A Foundation for Programming

any program you might want to write

objects
functions and modules
graphics, sound, and image I/O
databases
arrays
conditionals and loops
Math
text I/O

primitive data types
assignment statements

Functions (or Static Methods)

Java function.
- Takes zero or more input arguments.
- Returns one output value.
- Side effects (e.g., output to standard draw).

Applications:
- Scientists use mathematical functions to calculate formulas.
- Programmers use functions to build modular programs.
- You use functions for both.

Examples:
- Our I/O libraries: `StdIn.readInt()`, `StdDraw.line()`, `StdAudio.play()`.
- User-defined functions: `main()`.
Anatomy of a Java Function

Java functions. Easy to write your own.

\[ f(x) = \sqrt{x} \]

Input: 2.0  
Output: 1.414213...

Flow of Control

Key point. Functions provide a new way to control the flow of execution.

What happens when a function is called:
- Control transfers to the function code.
- Argument variables are assigned the values given in the call.
- Function code is executed.
- Return value is assigned in place of the function name in calling code.
- Control transfers back to the calling code.

Note. This is known as “pass by value.”

Scope

Scope (of a name). The code that can refer to that name.

Ex. A variable’s scope is code following the declaration in the block.

Best practice: declare variables to limit their scope.
Function Challenge 1a

Q. What happens when you compile and run the following code?

```java
public class Cubes1 {
    public static int cube(int i) {
        int j = i * i * i;
        return j;
    }
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        for (int i = 1; i <= N; i++)
            StdOut.println(i + " " + cube(i));
    }
}
```

```
javac Cubes1.java
java Cubes1 6
1
2
3 27
4 64
5 125
6 216
```

Function Challenge 1b

Q. What happens when you compile and run the following code?

```java
public class Cubes2 {
    public static int cube(int i) {
        int i = i * i * i;
        return i;
    }
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        for (int i = 1; i <= N; i++)
            StdOut.println(i + " " + cube(i));
    }
}
```

Function Challenge 1c

Q. What happens when you compile and run the following code?

```java
public class Cubes3 {
    public static int cube(int i) {
        i = i * i * i;
    }
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        for (int i = 1; i <= N; i++)
            StdOut.println(i + " " + cube(i));
    }
}
```

Function Challenge 1d

Q. What happens when you compile and run the following code?

```java
public class Cubes4 {
    public static int cube(int i) {
        i = i * i * i;
        return i;
    }
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        for (int i = 1; i <= N; i++)
            StdOut.println(i + " " + cube(i));
    }
}
```
Function Challenge 1e

Q. What happens when you compile and run the following code?

```java
public class Cubes5 {
    public static int cube(int i) {
        return i * i * i;
    }
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        for (int i = 1; i <= N; i++)
            StdOut.println(i + " " + cube(i));
    }
}
```

Function Examples

- **absolute value of an int value**
  ```java
  public static int abs(int x) {
      if (x < 0) return -x;
      else return x;
  }
  ```

- **absolute value of a double value**
  ```java
  public static double abs(double x) {
      if (x < 0.0) return -x;
      else return x;
  }
  ```

- **primality test**
  ```java
  public static boolean isPrime(int N) {
      if (N < 2) return false;
      for (int i = 2; i <= N / i; i++)
          if (N % i == 0) return false;
      return true;
  }
  ```

- **hypotenuse of a right triangle**
  ```java
  public static double hypotenuse(double a, double b) {
      return Math.sqrt(a*a + b*b);
  }
  ```

Gaussian Distribution

- Standard Gaussian distribution.
  - "Bell curve."
  - Basis of most statistical analysis in social and physical sciences.

Ex. 2000 SAT scores follow a Gaussian distribution with mean \( \mu = 1019 \), stddev \( \sigma = 209 \).
Java Function for $\phi(x)$

Mathematical functions. Use built-in functions when possible; build your own when not available.

```java
public class Gaussian {
    public static double phi(double x) {
        return Math.exp(-x*x / 2) / Math.sqr(2 * Math.Pi);
    }
    public static double phi(double x, double mu, double sigma) {
        return phi((x - mu) / sigma) / sigma;
    }
}
```

Overloading. Functions with different signatures are different.

Multiple arguments. Functions can take any number of arguments.

Calling other functions. Functions can call other functions.

Gaussian Cumulative Distribution Function

Goal. Compute Gaussian cdf $\Phi(z)$.

Challenge. No "closed form" expression and not in Java library.

Bottom line. 1,000 years of mathematical formulas at your fingertips.

SAT Scores

Q. NCAA requires at least 820 for Division I athletes. What fraction of test takers in 2000 do not qualify?

A. $\Phi(820, 1019, 209) \approx 0.17051$. [approximately 17%]

```java
public class Gaussian {
    public static double phi(double x) {
        if (x < 8.0) return 0.0;
        if (x > 8.0) return 1.0;
        double sum = 0.0, term = x;
        for (int i = 3; sum + term != sum; i += 2) {
            sum += term;
            term *= x * x / i;
        }
        return 0.5 + sum + phi(x);
    }
    public static double Phi(double x, double mu, double sigma) {
        return phi((x - mu) / sigma);
    }
}
```

```
x = 0.0
y = 0.0
for (i = 0; i < 100; i++)
    y = y + Math.sin(x) / Math.cos(x) / Math.sqrt(x); 
```

accurate with absolute error less than $8 \times 10^{-16}$

$\Phi(z, \mu, \sigma) = \int_{-\infty}^{z} \phi(x; \mu, \sigma) \, dx$
Gaussian Distribution

Q. Why relevant in mathematics?
A. Central limit theorem: under very general conditions, average of a set of random variables tends to the Gaussian distribution.

Q. Why relevant in the sciences?
A. Models a wide range of natural phenomena and random processes.
   - Weights of humans, heights of trees in a forest.
   - SAT scores, investment returns.

Caveat.

"Everybody believes in the exponential law of errors: the experimenters, because they think it can be proved by mathematics; and the mathematicians, because they believe it has been established by observation."  
— M. Lippman in a letter to H. Poincaré

Building Functions

Functions enable you to build a new layer of abstraction.
- Takes you beyond pre-packaged libraries.
- You build the tools you need: Gaussian.phi(), ...

Process.
- Step 1: identify a useful feature.
- Step 2: implement it.
- Step 3: use it.
- Step 3': re-use it in any of your programs.

Digital Audio

Crash Course in Sound

Sound. Perception of the vibration of molecules in our eardrums.

Concert A. Sine wave, scaled to oscillate at 440Hz.
Other notes. 12 notes on chromatic scale, divided logarithmically.
Digital Audio

Sampling. Represent curve by sampling it at regular intervals.

\[
y(i) = \sin \left( \frac{2\pi i \cdot 440}{44100} \right)
\]

Musical Tone Function

Musical tone. Create a music tone of a given frequency and duration.

```java
public static double[] tone(double hz, double seconds) {
    int SAMPLE_RATE = 44100;
    int N = (int) (seconds * SAMPLE_RATE);
    double[] a = new double[N+1];
    for (int i = 0; i < N; i++) {
        a[i] = Math.sin(2 * Math.PI * i * hz / SAMPLE_RATE);
    }
    return a;
}
```

Remark. Can use arrays as function return value and/or argument.

Digital Audio in Java

Standard audio. Library for playing digital audio.

```java
public class StdAudio {
    void play(String file) { /* play the given wav file */ }
    void play(double[] a) { /* play the given sound wave */ }
    void play(double x) { /* play sample for 1/44100 second */ }
    void save(String file, double[] a) { /* save to a wav file */ }
    double[] read(String file) { /* read from a wav file */ }
}
```

Concert A. Play concert A for 1.5 seconds using StdAudio.

```java
double[] a = tone(440, 1.5);
StdAudio.play(a);
```

Harmonics

Concert A with harmonics. Obtain richer sound by adding tones one octave above and below concert A.

- 880 Hz
- 220 Hz
- 440 Hz

\[
\begin{align*}
&880 \text{ Hz} \\
&220 \text{ Hz} \\
&440 \text{ Hz}
\end{align*}
\]
Harmonics

```java
public class PlayThatTuneDeluxe {
    // return weighted sum of two arrays
    public static double[] sum(double[] a, double[] b, double awt, double bwt) {
        double[] c = new double[a.length];
        for (int i = 0; i < a.length; i++)
            c[i] = a[i]*awt + b[i]*bwt;
        return c;
    }
    // return a note of given pitch and duration
    public static double[] note(int pitch, double duration) {
        double hz = 440.0 * Math.pow(2, pitch / 12.0);
        double[] a = tone(1.0 * hz, duration);
        double[] hi = tone(2.0 * hz, duration);
        double[] lo = tone(0.5 * hz, duration);
        double[] h = sum(hi, lo, 0.5, 0.5);
        return sum(a, h, 0.5, 0.5);
    }
    public static double[] tone(double hz, double t) {
        // see previous slide
    }
    public static void main(String[] args) {
        // see next slide
    }
}
```

Play that tune. Read in pitches and durations from standard input, and play using standard audio.

```java
public static void main(String[] args) {
    while (!StdIn.isEmpty()) {
        int pitch = StdIn.readInt();
        double duration = StdIn.readDouble();
        double[] a = note(pitch, duration);
        StdAudio.play(a);
    }
}
```

Libraries

Library. A module whose methods are primarily intended for use by many other programs.

Client. Program that calls a library.

API. Contract between client and implementation.

Implementation. Program that implements the methods in an API.
Random Numbers

The generation of random numbers is far too important to leave to chance. Anyone who considers arithmetical methods of producing random digits is, of course, in a state of sin.  

-- Jon von Neumann

Standard Random

Our library to generate pseudo-random numbers.

```java
public class StdRandom {
    public static double uniform(double a, double b) {
        return a + Math.random() * (b-a);
    }

    public static int uniform(int N) {
        return (int) (Math.random() * N);
    }

    public static boolean bernoulli(double p) {
        return Math.random() < p;
    }

    public static double gaussian() {
        return bernoulli();
    }

    // gaussian with mean = 0, stddev = 1
    public static double gaussian() {
    }

    // gaussian with given mean and stddev
    public static double gaussian(double mean, double stddev) {
        return mean + stddev * gaussian();
    }
}
```

Unit Testing

Unit test. Include main() to test each library.

```java
public class StdRandom {
    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        for (int i = 0; i < N; i++) {
            StdOut.printf("%d", uniform(0, 1000));
        }
        StdOut.println();
    }
}
```

Sample output:

```
51 72 36 26 61 24 77 68 63 35
```

% java StdRandom 5
61 21.76541  true 9.30910
57 43.64327 false 9.42369
31 30.86201  true 9.06366
92 39.59314  true 9.00896
36 28.27256 false 8.66800
Using a Library

```java
public class RandomPoints {
    public static void main(String args[]) {
        int N = Integer.parseInt(args[0]);
        for (int i = 0; i < N; i++) {
            double x = StdRandom.gaussian(0.5, 0.2);
            double y = StdRandom.gaussian(0.5, 0.2);
            StdDraw.point(x, y);
        }
    }
}
```

```
javac RandomPoints.java
java RandomPoints 10000
```

Statistics

Standard Statistics

Ex. Library to compute statistics on an array of real numbers.

```java
public class StdStats {
    public static double max(double[] a) {
        double max = Double.NEGATIVE_INFINITY;
        for (int i = 0; i < a.length; i++)
            if (a[i] > max) max = a[i];
        return max;
    }
    public static double mean(double[] a) {
        double sum = 0.0;
        for (int i = 0; i < a.length; i++)
            sum = sum + a[i];
        return sum / a.length;
    }
    public static double stddev(double[] a) {
        double mean = mean(a);
        double var = 0.0;
        for (int i = 0; i < a.length; i++)
            var = var + Math.pow(a[i] - mean, 2);
        return Math.sqrt(var / (a.length - 1));
    }
}
```

Ex. Library to compute statistics on an array of real numbers.
Modular Programming

- Divide program into self-contained pieces.
- Test each piece individually.
- Combine pieces to make program.

**Ex.** Flip N coins. How many heads?
- Read arguments from user.
- Flip one fair coin.
- Flip N fair coins and count number of heads.
- Repeat simulation, counting number of times each outcome occurs.
- Plot histogram of empirical results.
- Compare with theoretical predictions.

```java
public class Bernoulli {
    public static int binomial(int N) {
        int heads = 0;
        for (int j = 0; j < N; j++)
            if (StdRandom.bernoulli(0.5)) heads++;
        return heads;
    }

    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        int T = Integer.parseInt(args[1]);
        int[] freq = new int[N+1];
        for (int i = 0; i <= N; i++)
            freq[i] = binomial(N); // theoretical prediction
        double[] normalized = new double[N+1];
        double mean = N / 2.0, stddev = Math.sqrt(N) / 2.0;
        for (int i = 0; i <= N; i++)
            normalized[i] = (double) freq[i] / T;
        StdStats.plotBars(normalized);
        StdStats.plotBars(freq);
    }
}
```

Bernoulli Trials

```
public class Bernoulli {
    public static int binomial(int N) {
        int heads = 0;
        for (int j = 0; j < N; j++)
            if (StdRandom.bernoulli(0.5)) heads++;
        return heads;
    }

    public static void main(String[] args) {
        int N = Integer.parseInt(args[0]);
        int T = Integer.parseInt(args[1]);
        int[] freq = new int[N+1];
        for (int i = 0; i <= N; i++)
            freq[i] = binomial(N); // theoretical prediction
        double[] normalized = new double[N+1];
        double mean = N / 2.0, stddev = Math.sqrt(N) / 2.0;
        for (int i = 0; i <= N; i++)
            normalized[i] = (double) freq[i] / T;
        StdStats.plotBars(normalized);
        StdStats.plotBars(freq);
    }
}
```

Dependency Graph

Modular programming. Build relatively complicated program by combining several small, independent, modules.
Libraries

Why use libraries?
- Makes code easier to understand.
- Makes code easier to debug.
- Makes code easier to maintain and improve.
- Makes code easier to reuse.
