

Pipe example

Goal: (functionality of `> ls | wc`)

Key

process with command = cmd
and process id = pid
parent/child relation

pipe: left is write, right is read

file descriptor i, open for reading

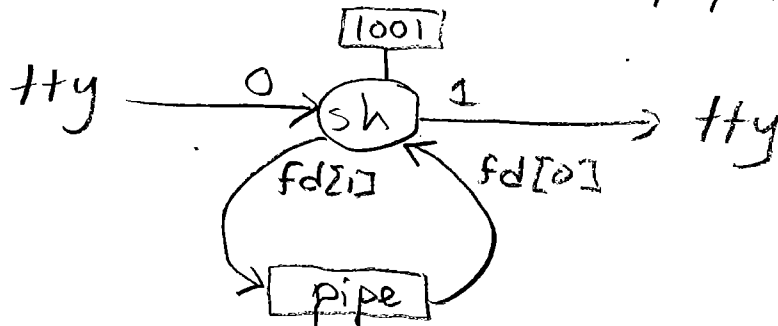

file descriptor j, open for writing

Initially:

Steps

1) sh (1001) executes pipe(fd)

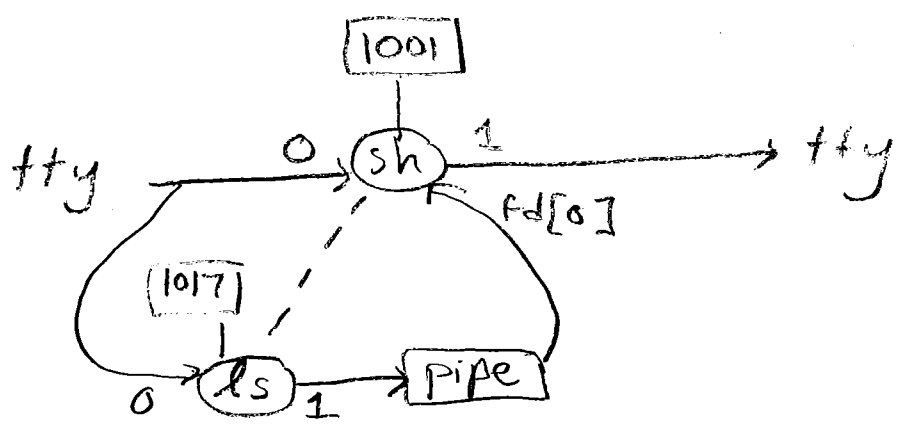

creates a pipe and two new open file descriptors =
fd[0] = read
fd[1] = write

2) sh(1001) executes fork()

creates a new process: sh(1017) which has copies of its parent's open file descriptors 0, 1, fd[0], fd[1]

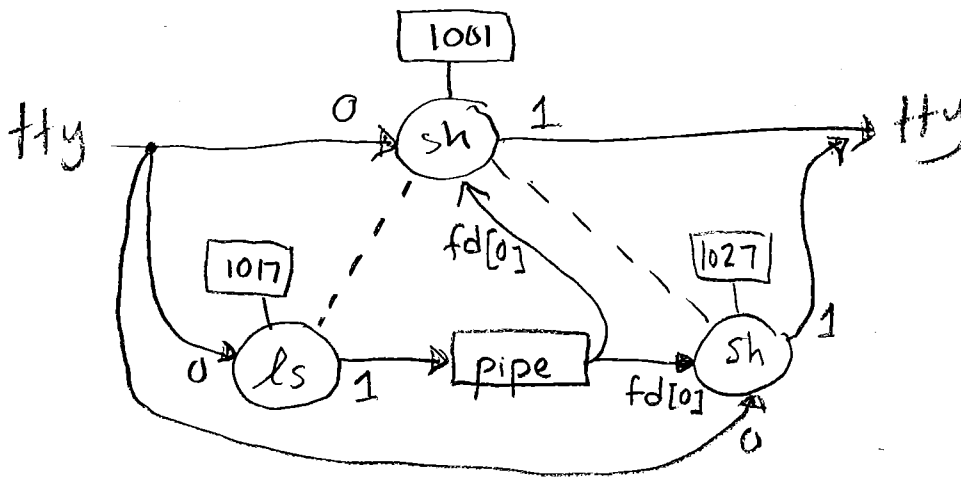

3) sh(1001) executes close(fd[1])
 sh(1017) executes
 close(fd[0]), dup2(fd[1], 1),
 close(fd[1]), exec(ls)

closes unneeded file descriptors, replaces process 1017 fd 1 by write fd for pipe, starts ls

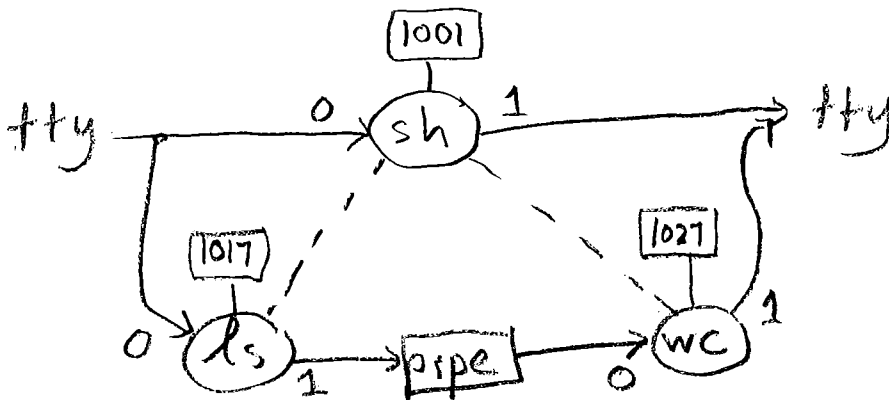

4) sh(1001) executes fork()

3/5

creates a new process: sh(1027) which has copies of its parent's open file descriptors: 0, 1, fd[0]

5) sh(1001) executes close(fd[0]) and waits for both child processes (1017, 1027) to terminate
 sh(1027) executes dup2(fd[0], 0), close(fd[0]), exec(wc)

closes unneeded file descriptor
 replaces process 1027 fd 0 by read fd for pipe
 starts wc

(sh(1001) suspends execution until the two child processes terminate)

[Goal achieved]

Another view of this is how information in the process table changes.

Initially:

pid=1001	open fds
0	tty, r
1	tty, w
2	tty, w

1) sh (1001) executes pipe(fd)
 (Assume it returns fd[0]=3 and fd[1]=4.)

Then:

new fds
Created for pipe

pid=1001	open fds
0	tty, r
1	tty, w
2	tty, w
3	pipe, r
4	pipe, w

2) sh (1001) executes fork()

Then:

open fds
copied to
child
process

pid=1001	open fds
0	tty, r
1	tty, w
2	tty, w
3	pipe, r
4	pipe, w

pid=1017	open fds
0	tty, r
1	tty, w
2	tty, w
3	pipe, r
4	pipe, w

3) Suppose sh(1001) has executed close(fd[1]) and sh(1017) has executed close(fd[0])

Then:

entry for 4 removed from 1001's table

pid=1001	open fds
0	tty, r
1	tty, w
2	tty, w
3	pipe, r

entry for 3 removed from 1017's table

pid 1017	open fds
0	tty, r
1	tty, w
2	tty, w
4	pipe, w

3 continued) Suppose sh(1017) has now executed dup2(fd[3], 1)

Then

pid=1001	open fds
0	tty, r
1	tty, w
2	tty, w
3	pipe, r

entry in 1017's table for 4 copied to 1

pid=1017	open fds
0	tty, r
1	pipe, w
2	tty, w
4	pipe, w

[And so on.]
