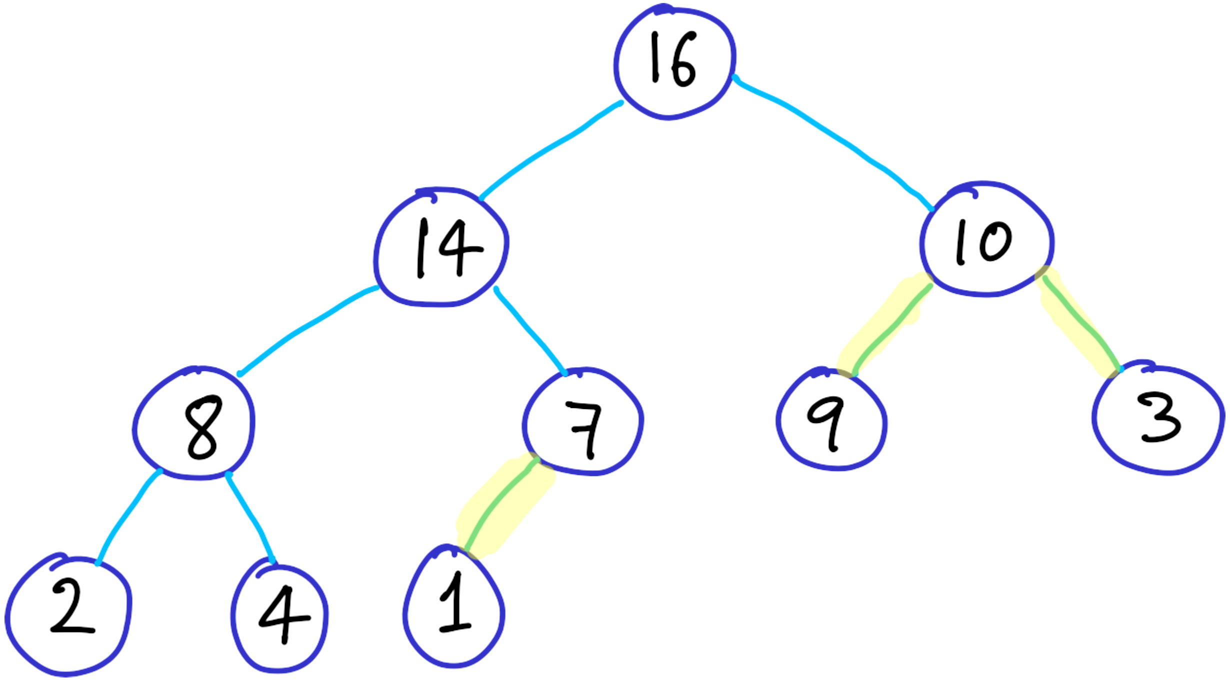
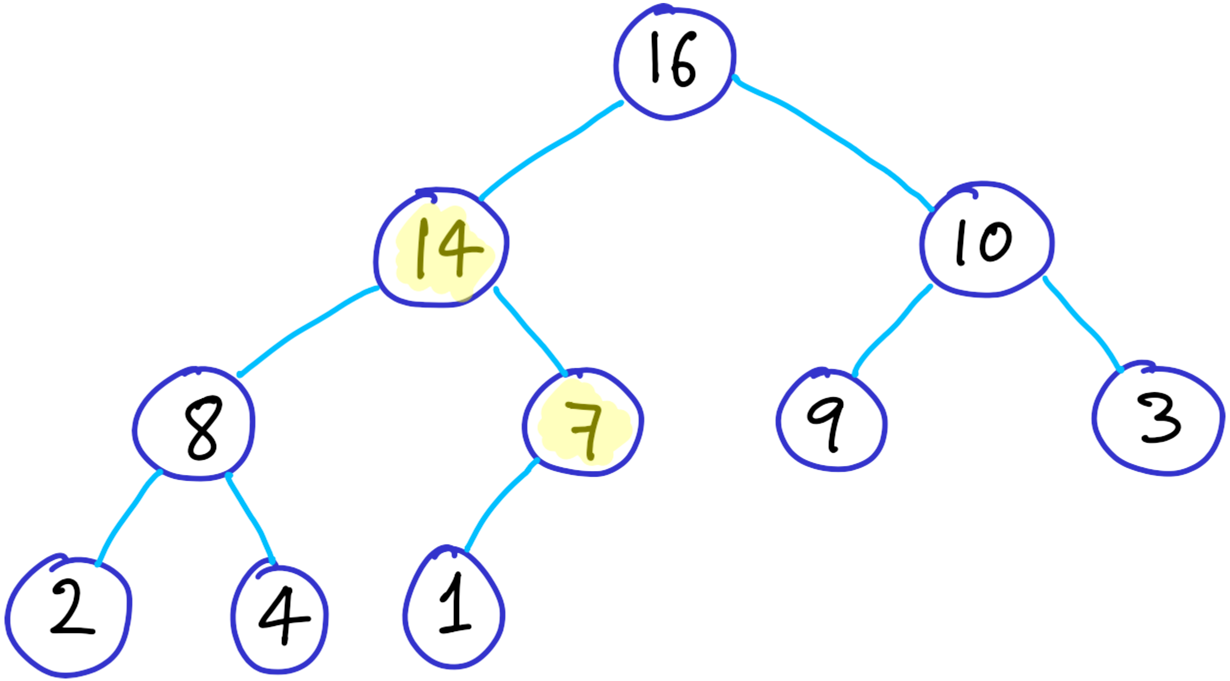
Rules:

- binary
- max
- complete



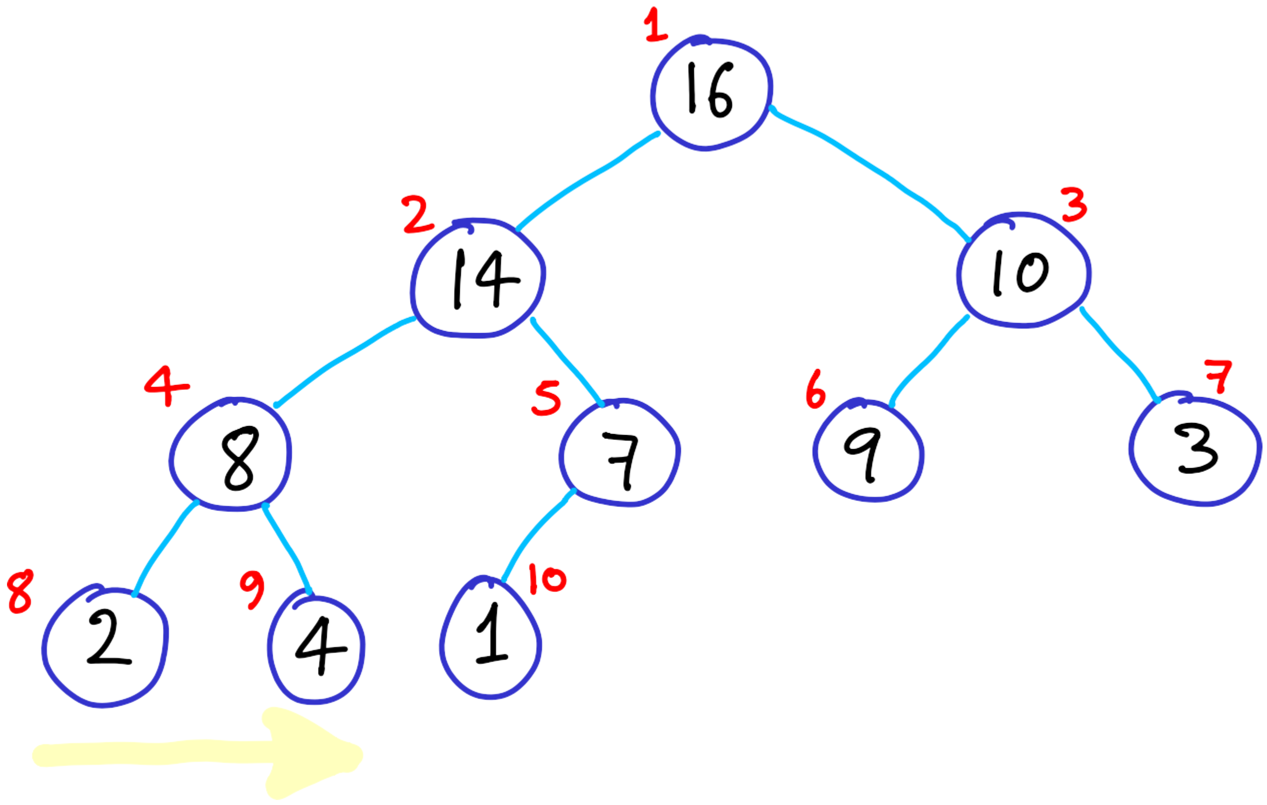
Rules:

- binary: internal nodes have 1 or 2 children
- max
- complete



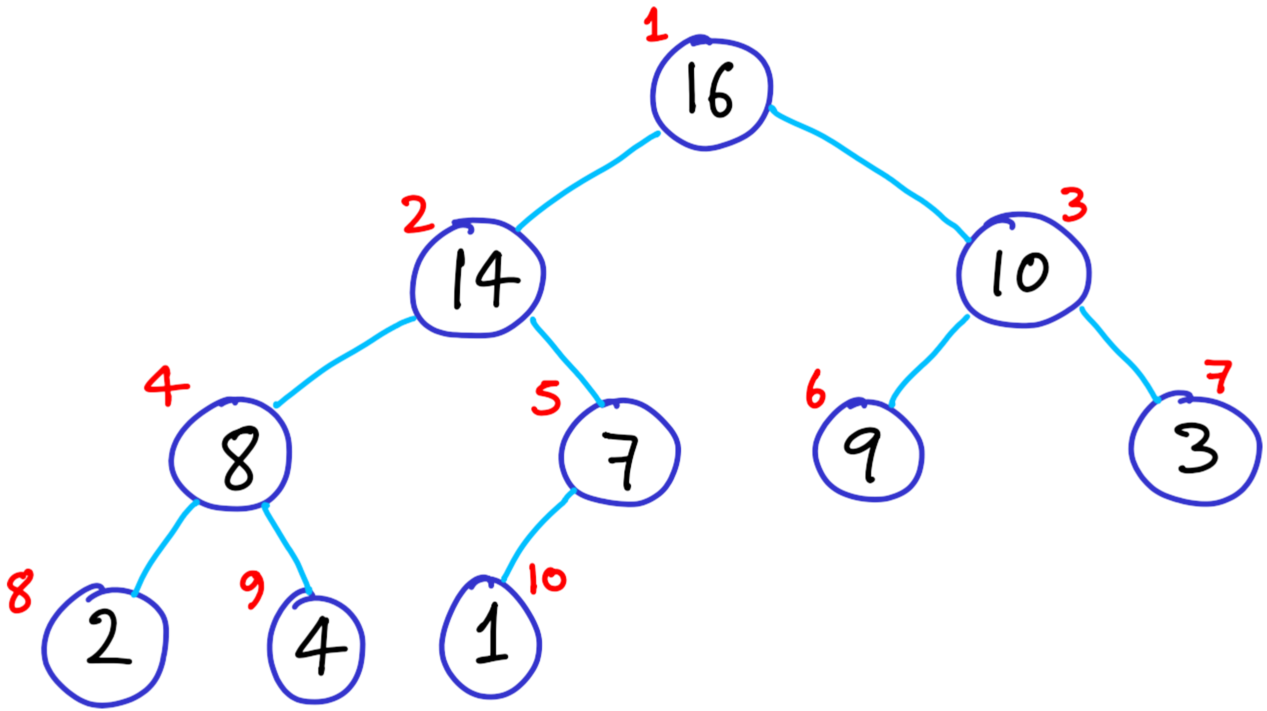
Rules:

- binary: internal nodes have 1 or 2 children
- max: parent ≥ child
- complete



Rules:

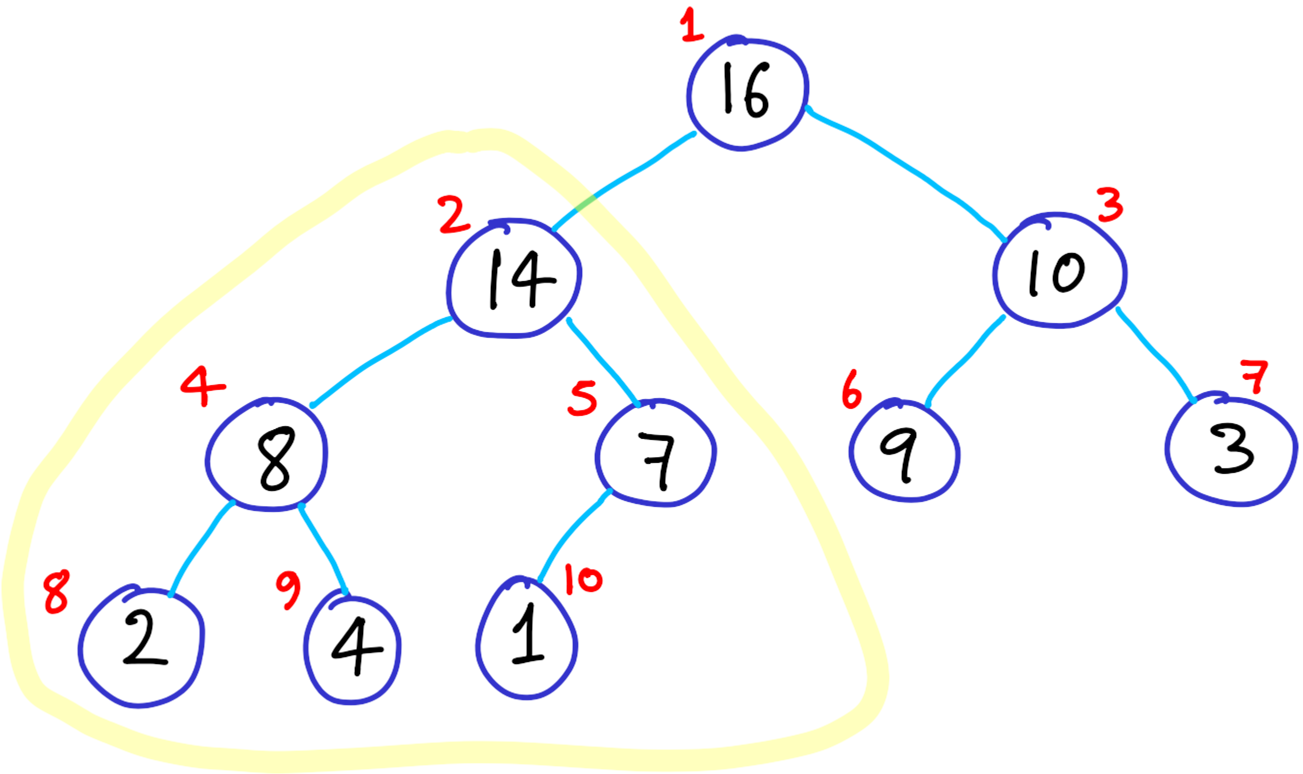
- **binary:** internal nodes have 1 or 2 children
- **max:** parent ≥ child
- **complete:** all levels filled (lowest can be partial, left to right)



Rules:

- **binary:** internal nodes have 1 or 2 children
- **max:** parent ≥ child
- **complete:** all levels filled (lowest can be partial, left to right)

some applications don't need this but we will enforce it

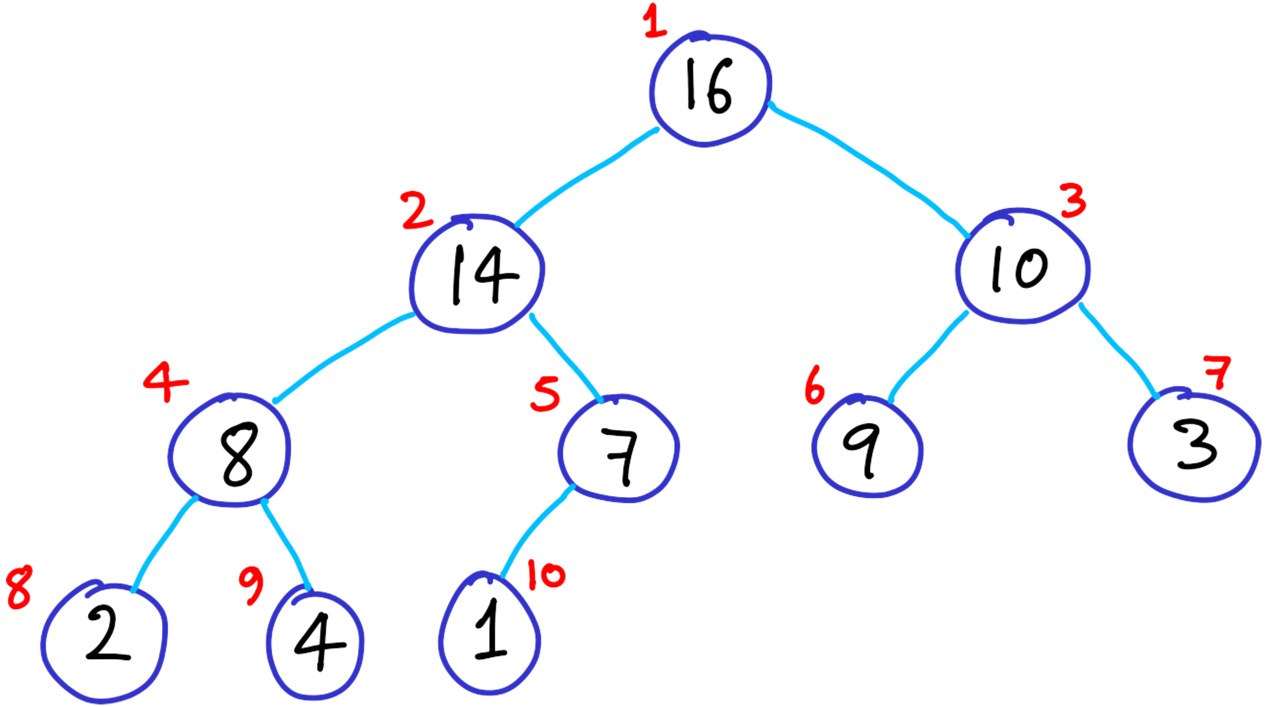


[Notice every subtree is also a heap]

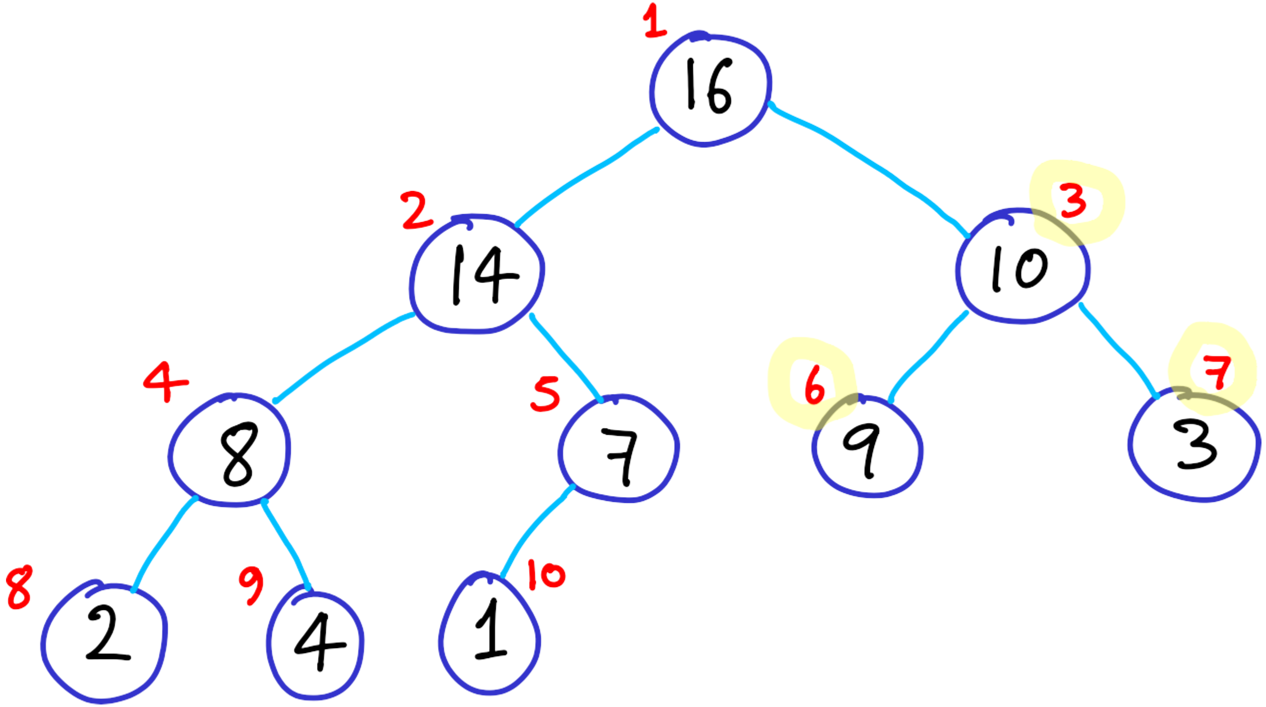
Rules:

- binary: internal nodes have 1 or 2 children
- max: parent ≥ child
- complete: all levels filled (lowest can be partial, left to right)

some applications don't need this but we will enforce it



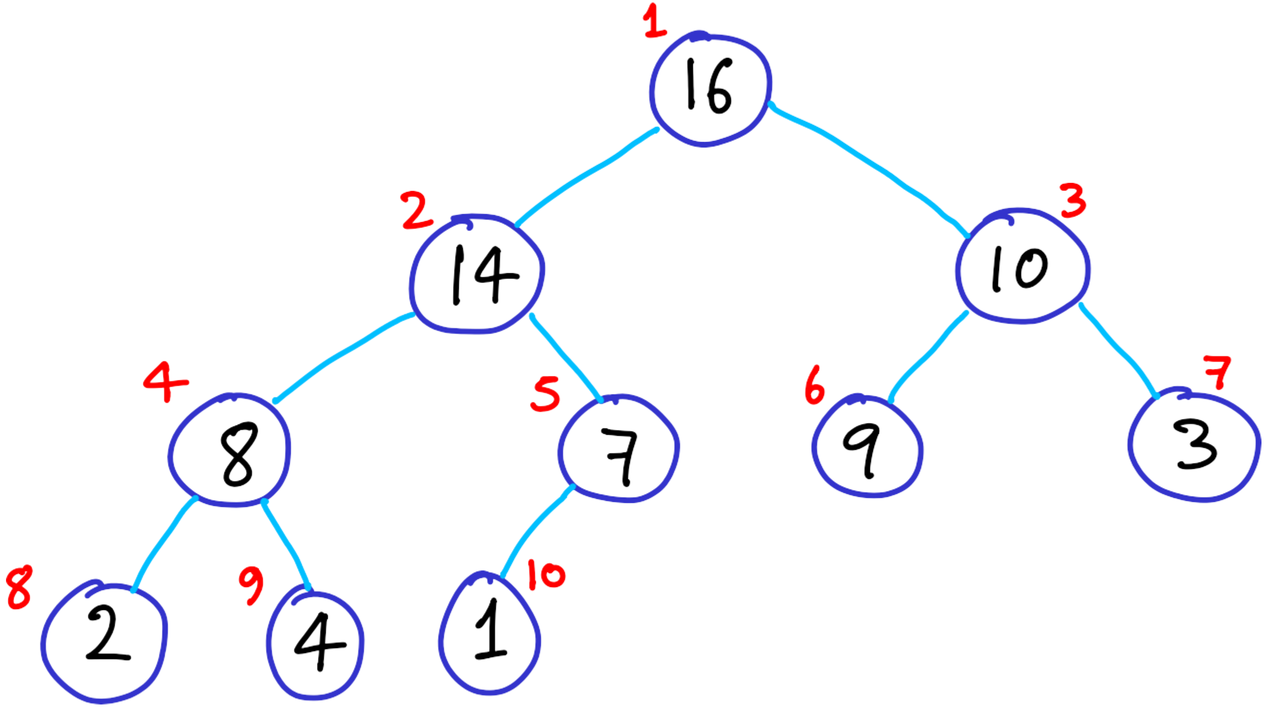
How can we identify the indices of the children of a given node?



How can we identify the indices of the children of a given node?

left-child(i) = 2i

right-child(i) = 2i+1

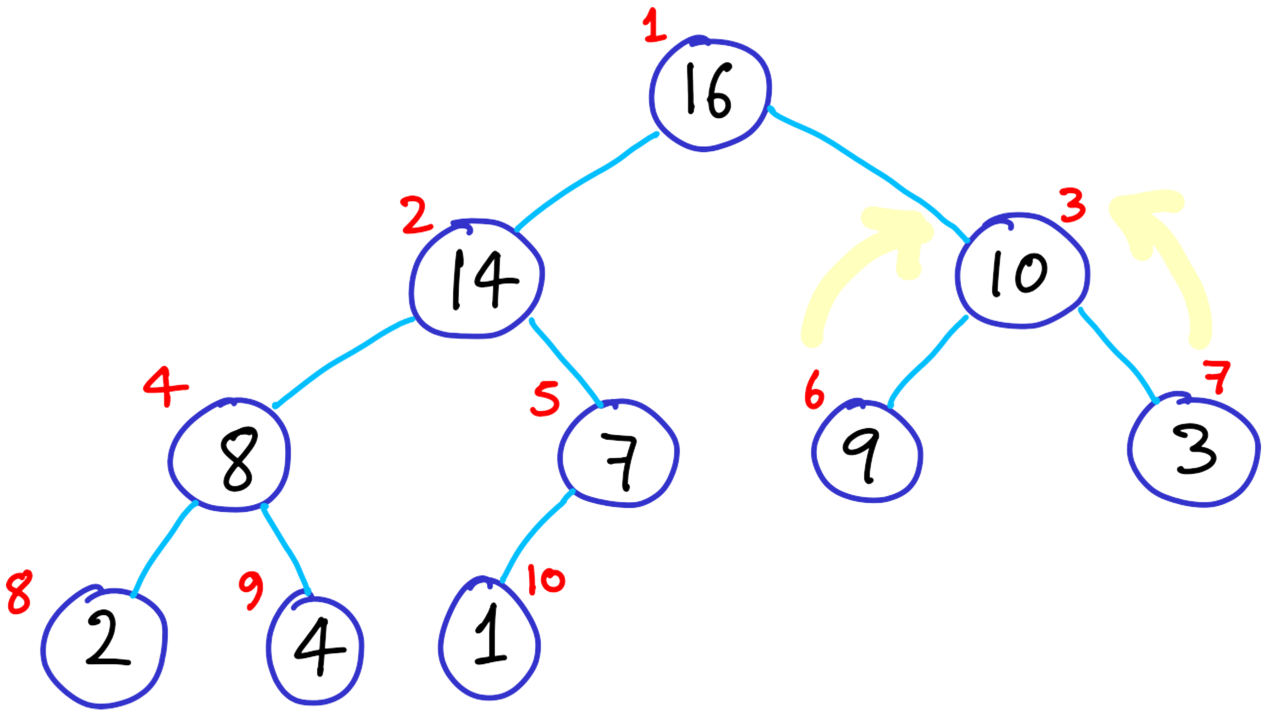


How can we identify the indices of the children of a given node?

left-child(i) = 2i

right-child(i) = 2i+1

parent(i) = ?

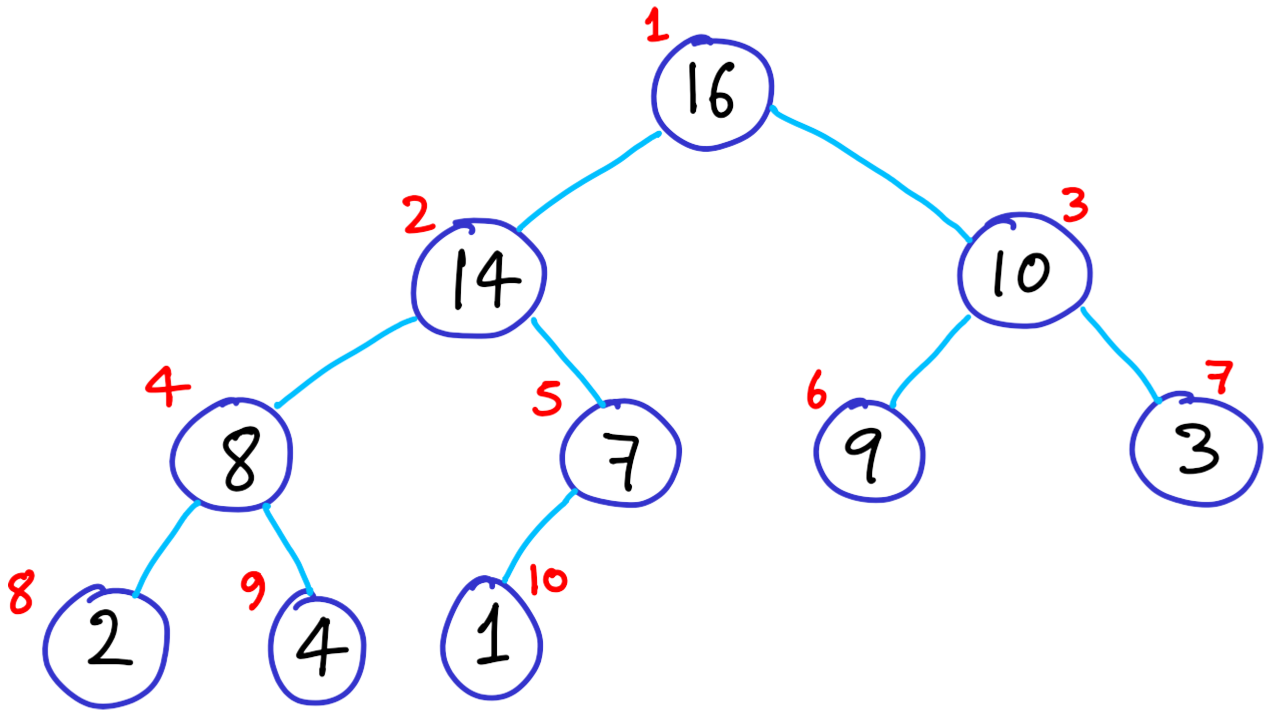


How can we identify the indices of the children of a given node?

left-child(i) = $2i$

right-child(i) = $2i+1$

parent(i) = $\lfloor i/2 \rfloor$



How can we identify the indices of the children of a given node?

Use array to store heap

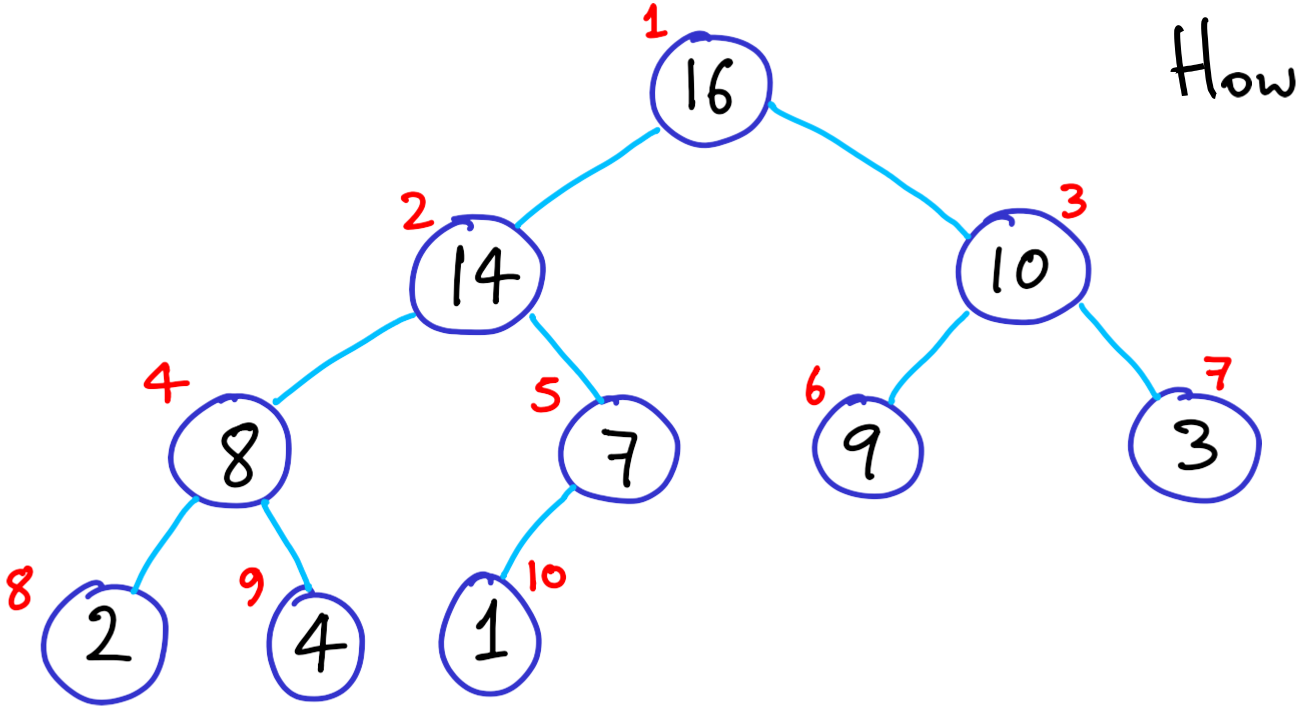
(avoid wasting space with pointers)

1	2	3	4	5	6	7	8	9	10	
16	14	10	8	7	9	3	2	4	1	.....

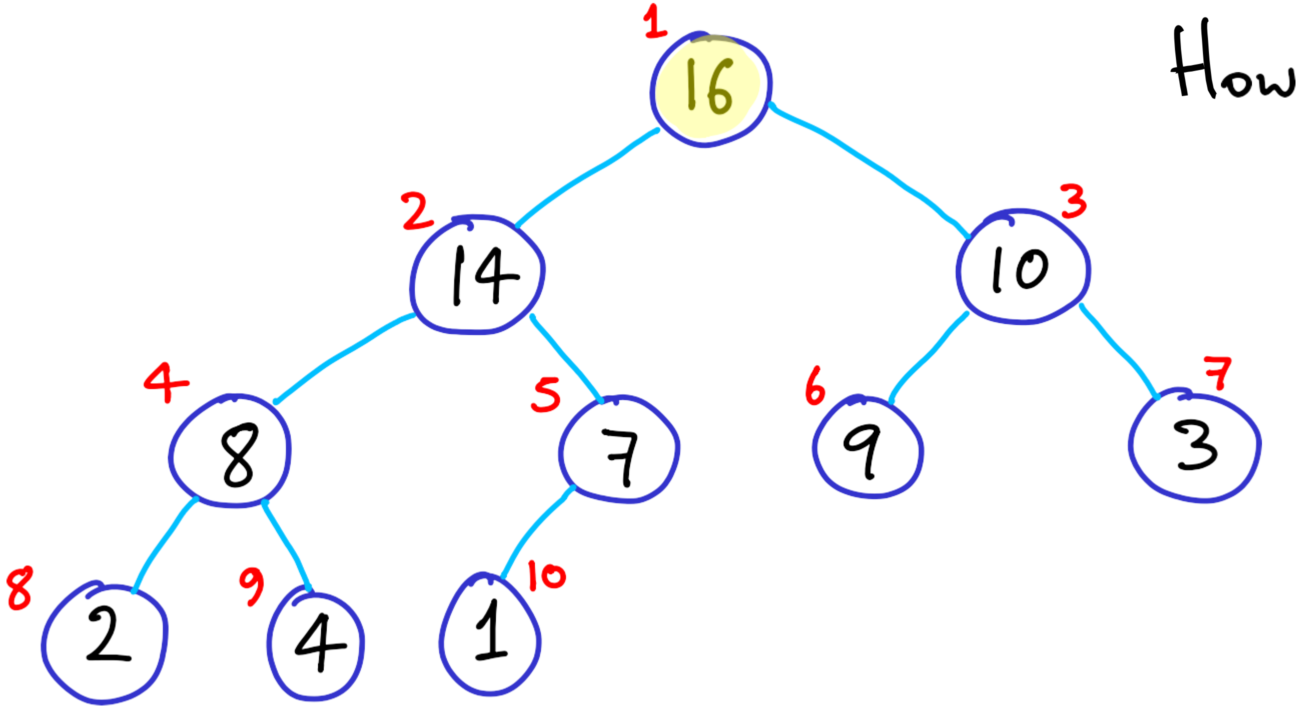
$\text{left-child}(i) = 2i$

$\text{right-child}(i) = 2i+1$

$\text{parent}(i) = \lfloor i/2 \rfloor$

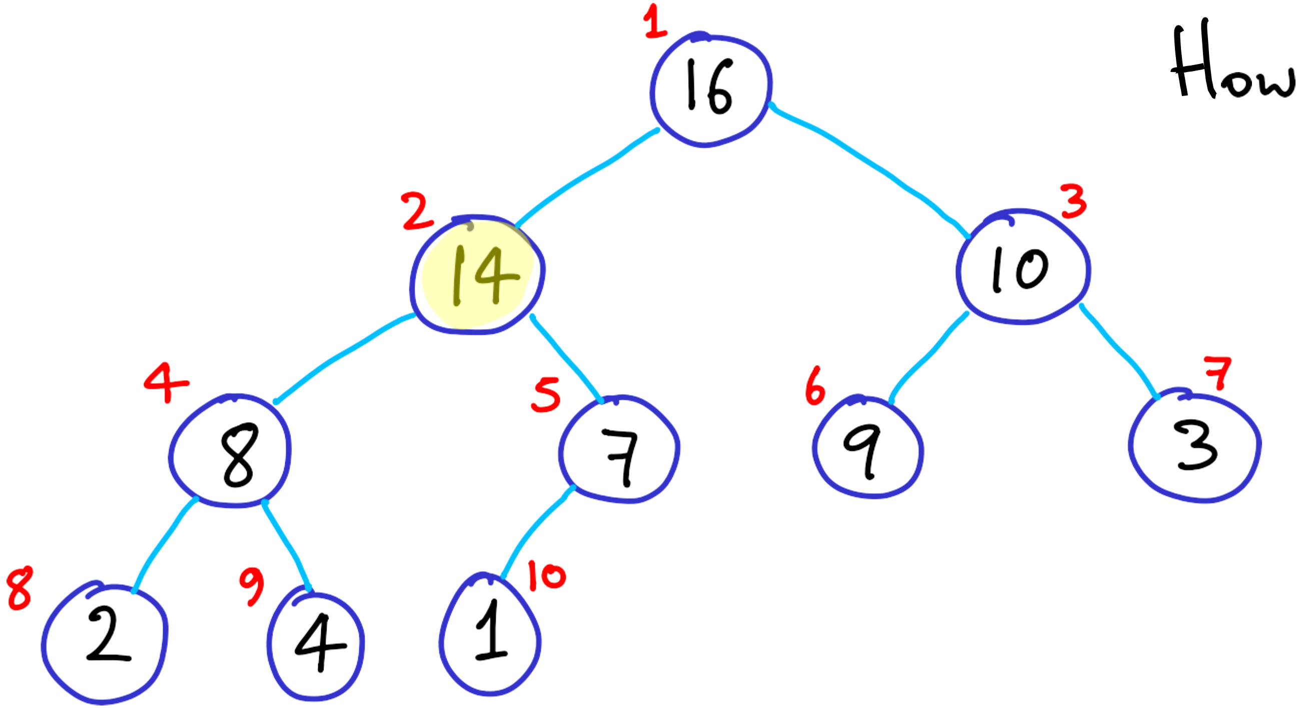


How does this relate to sorting?



How does this relate to sorting?

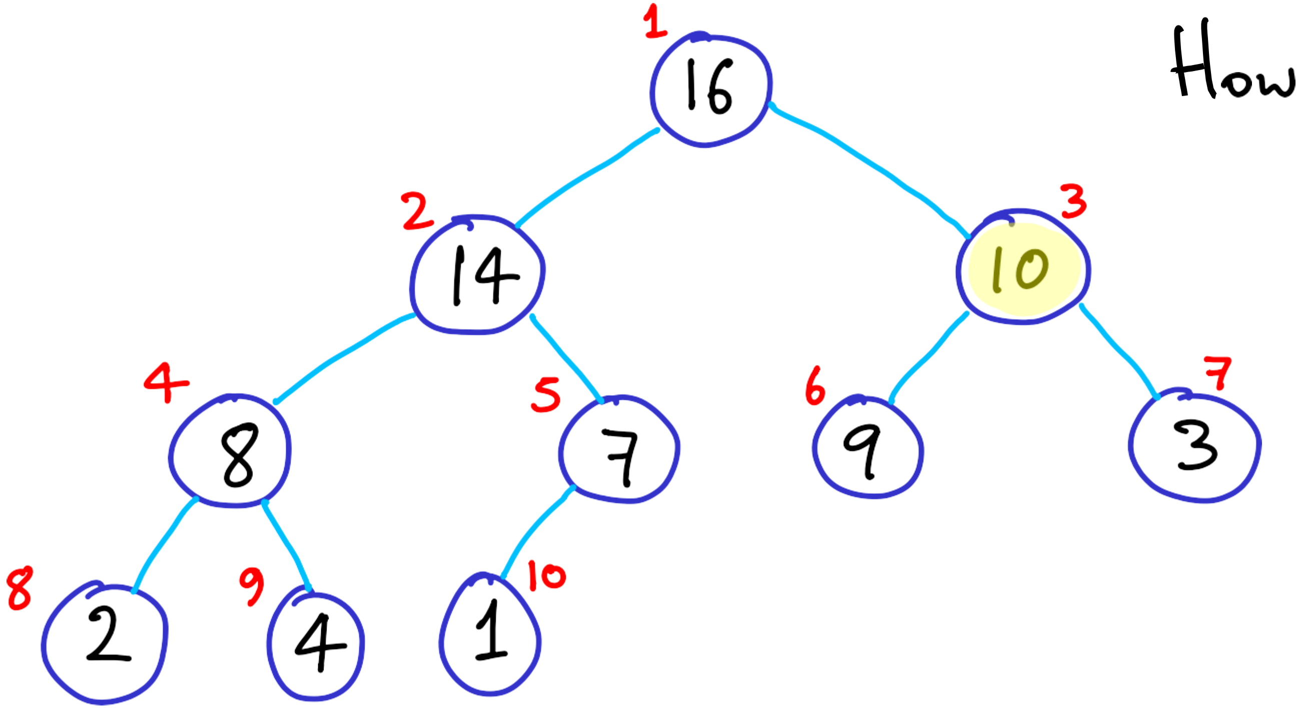
Largest element is on top.



How does this relate to sorting?

Largest element is on top.

2nd largest is in level 2.



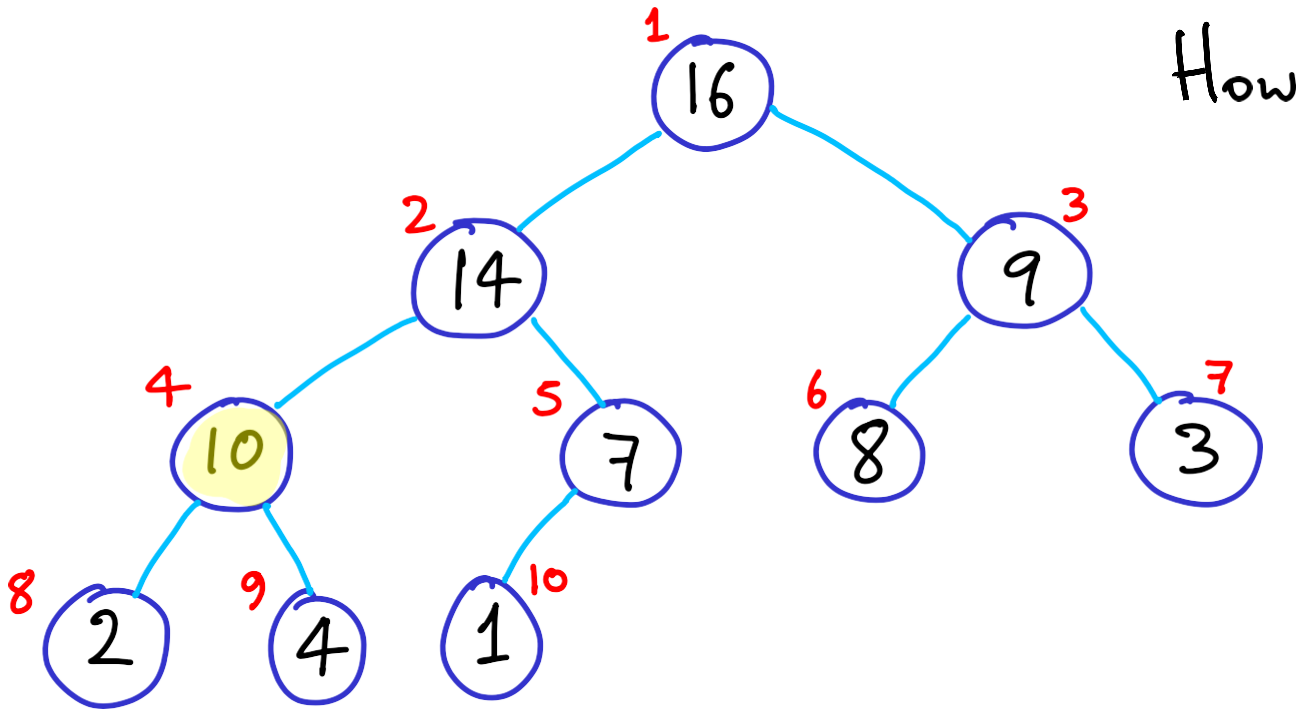
How does this relate to sorting?

Largest element is on top.

2nd largest is in level 2.

3rd largest is

↳ in level 2



How does this relate to sorting?

Largest element is on top.

2nd largest is in level 2.

3rd largest is

↳ in level 2

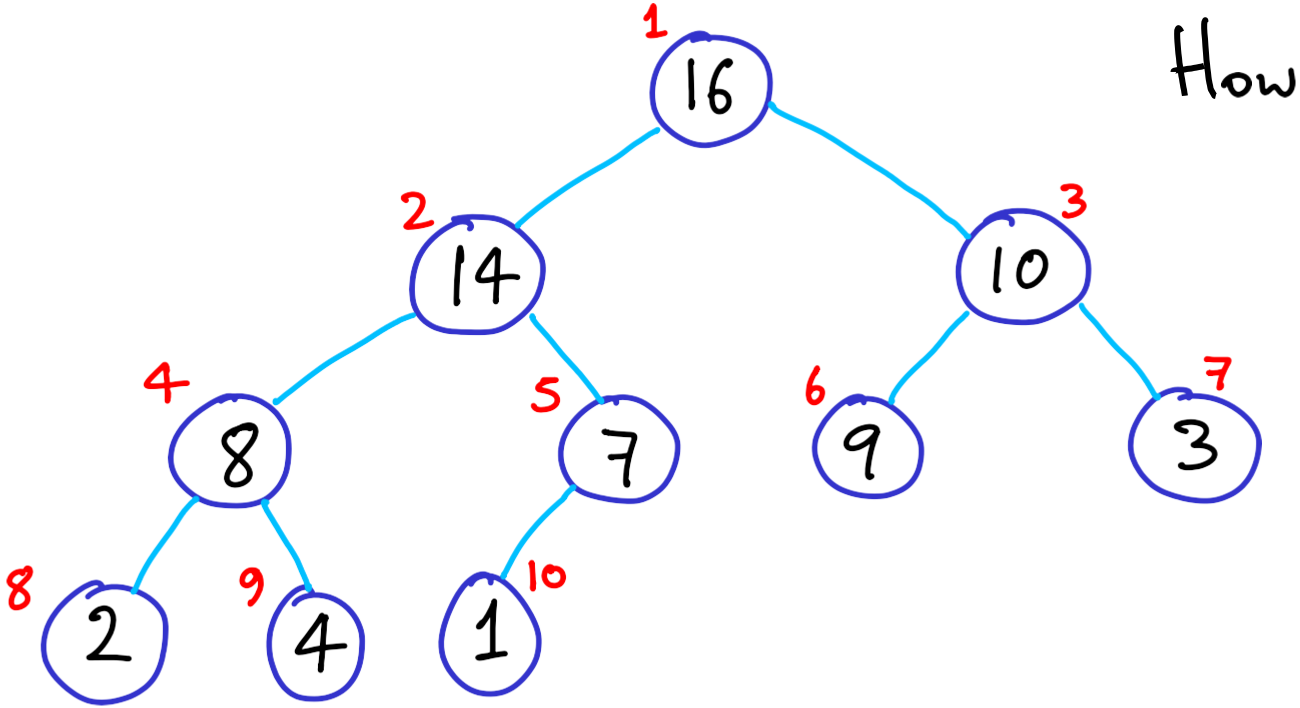
OR

↳ in level 3

& child of 2nd

⋮

getting messy



How does this relate to sorting?

Largest element is on top.

2nd largest is in level 2.

3rd largest is

↳ in level 2

OR

↳ in level 3

& child of 2nd

⋮

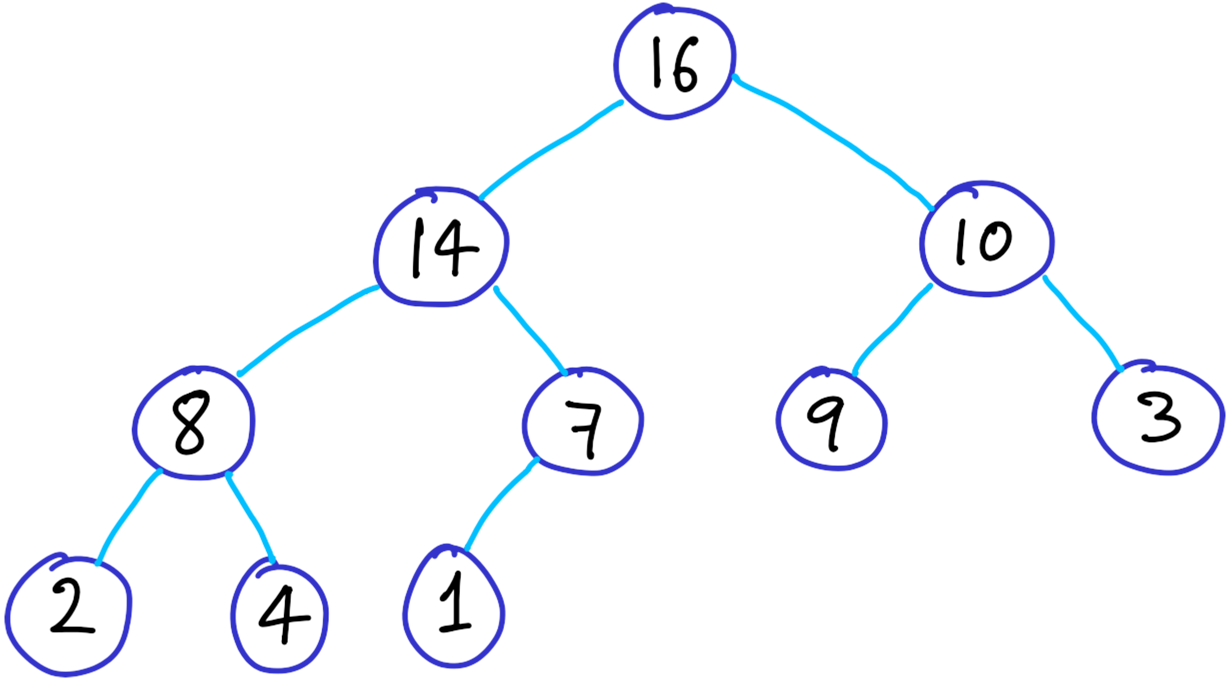
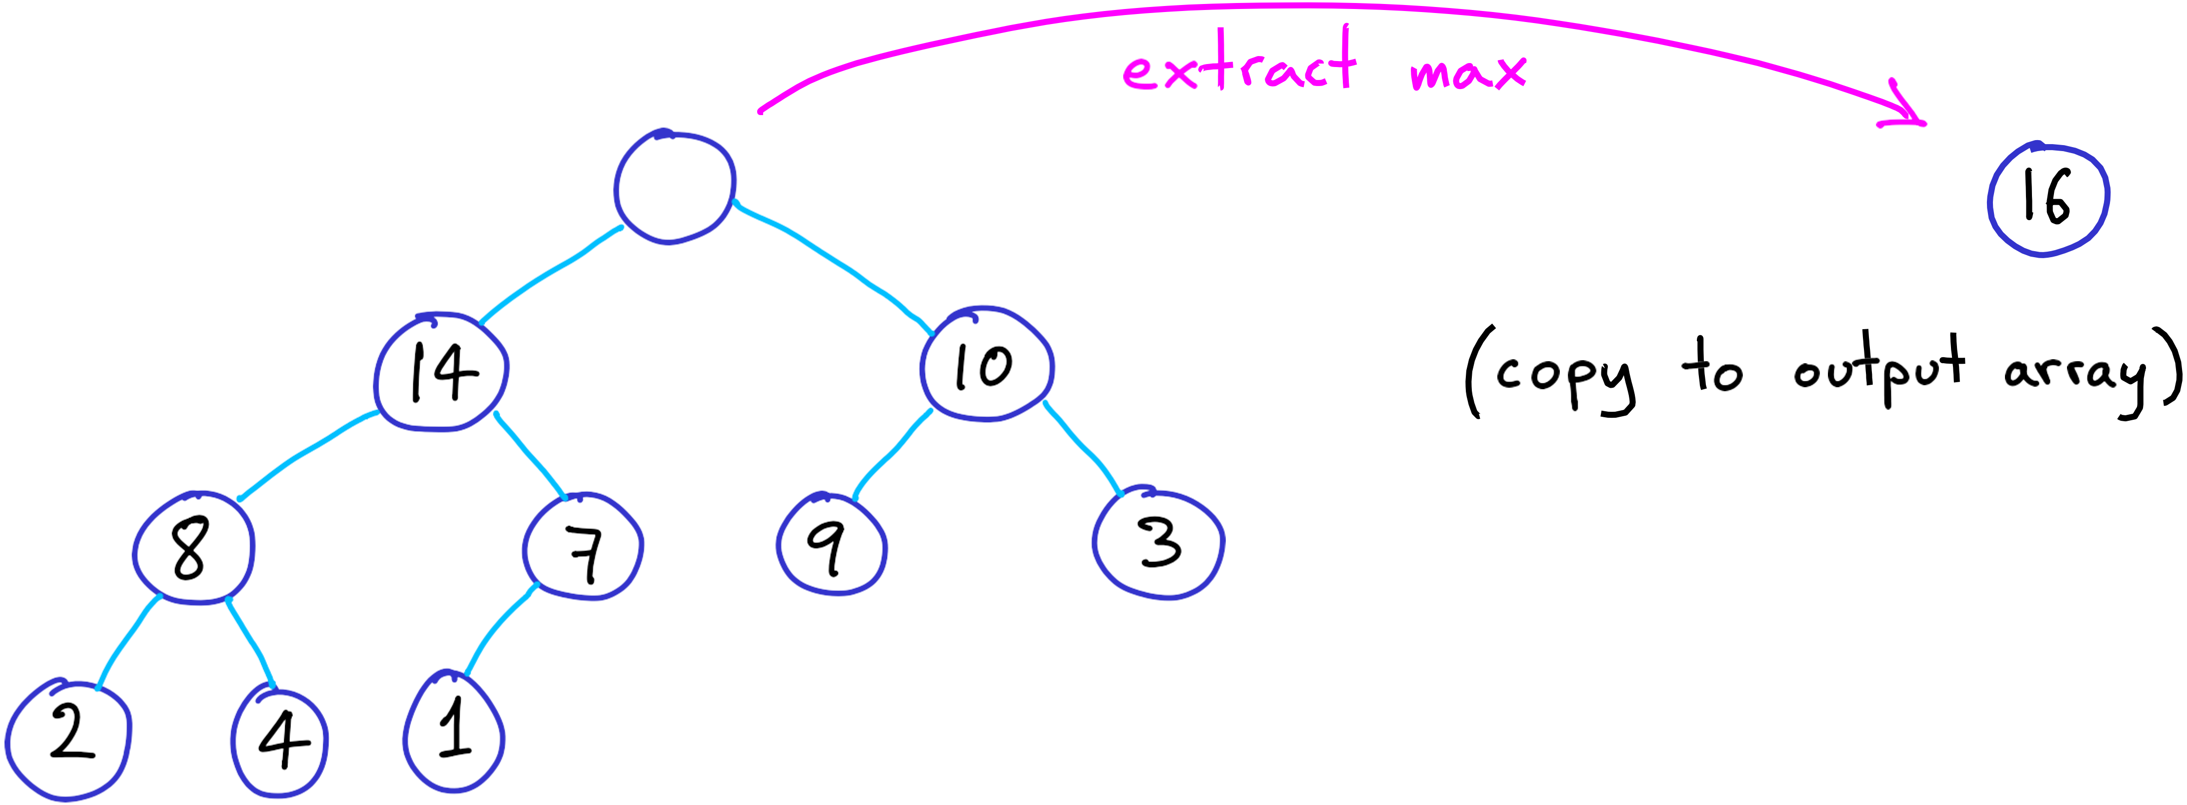
Heaps are not "sorted"

How to sort data in a heap

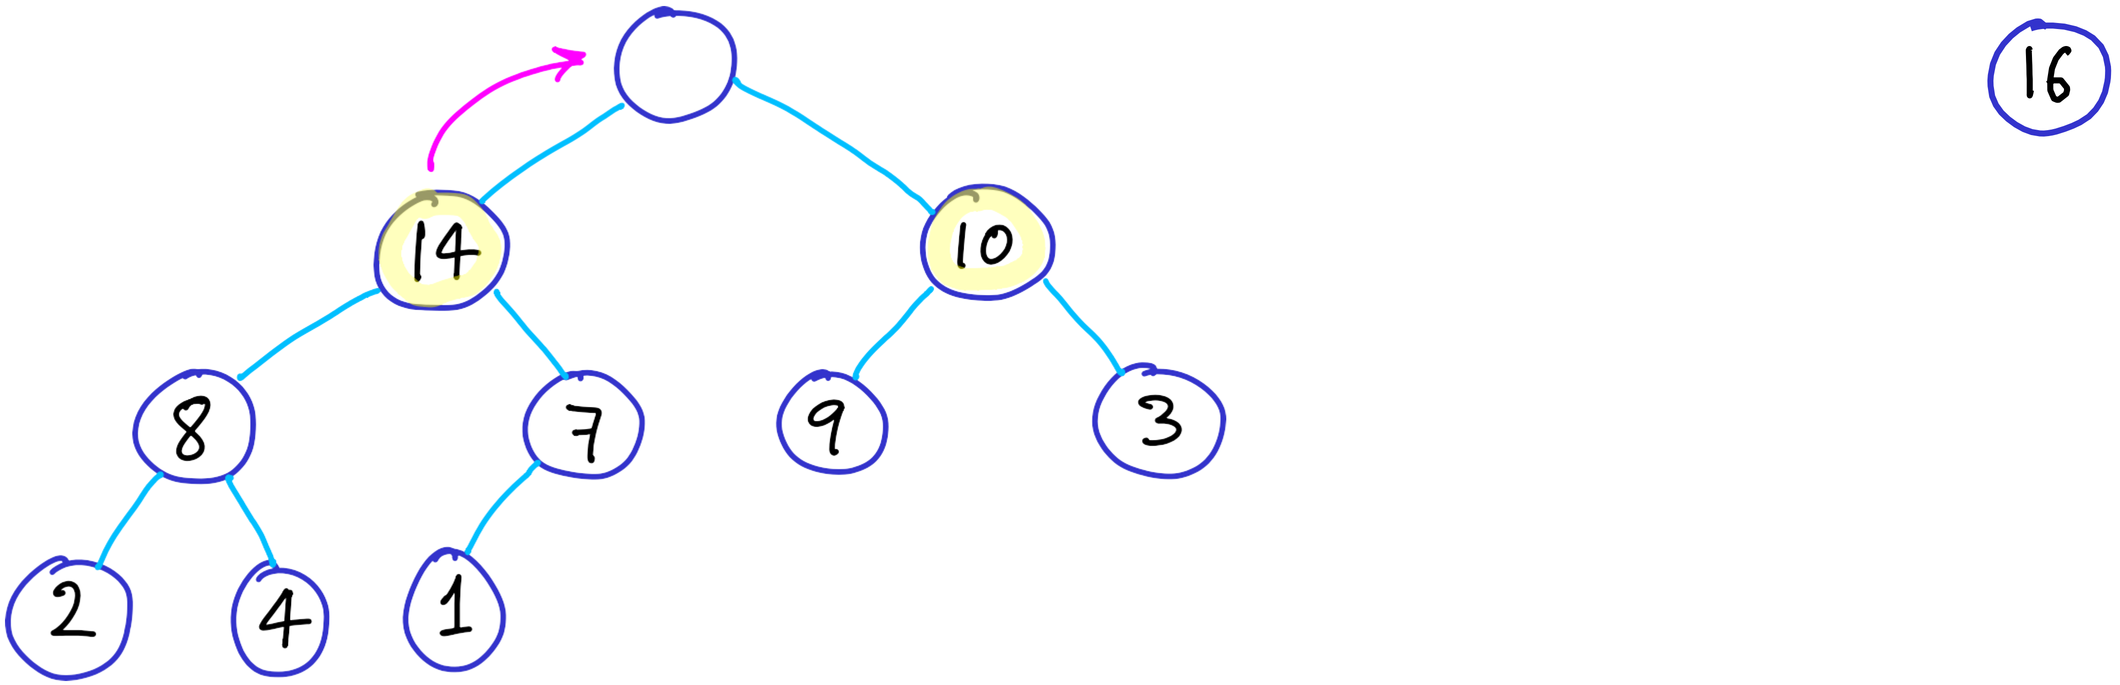


How to sort data in a heap

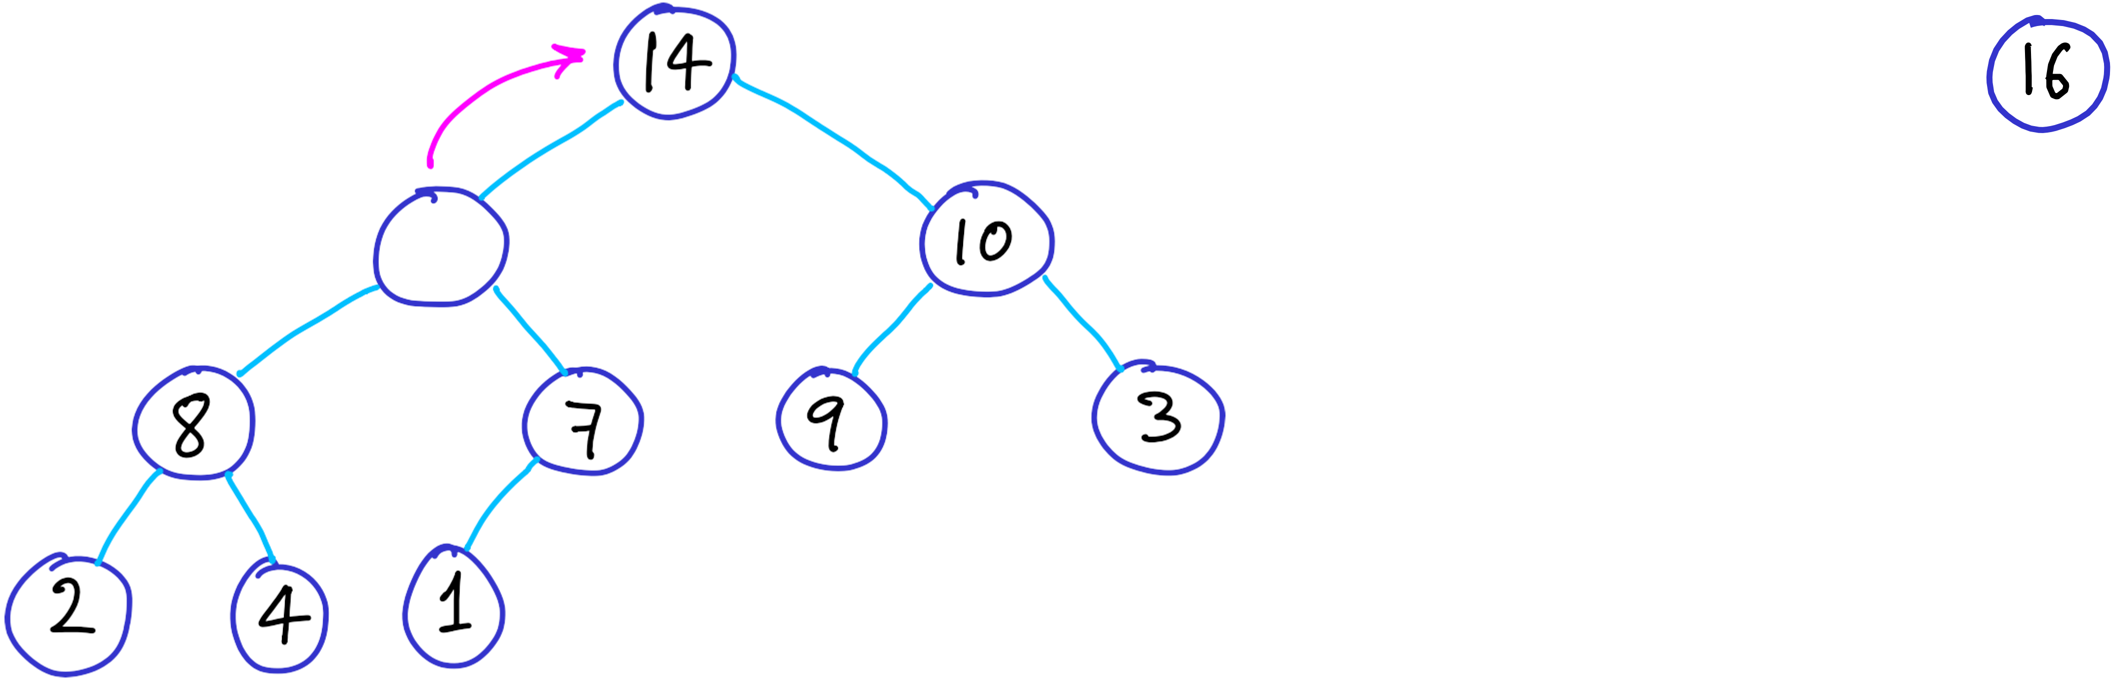


How to sort data in a heap

Update max : larger of 2 children

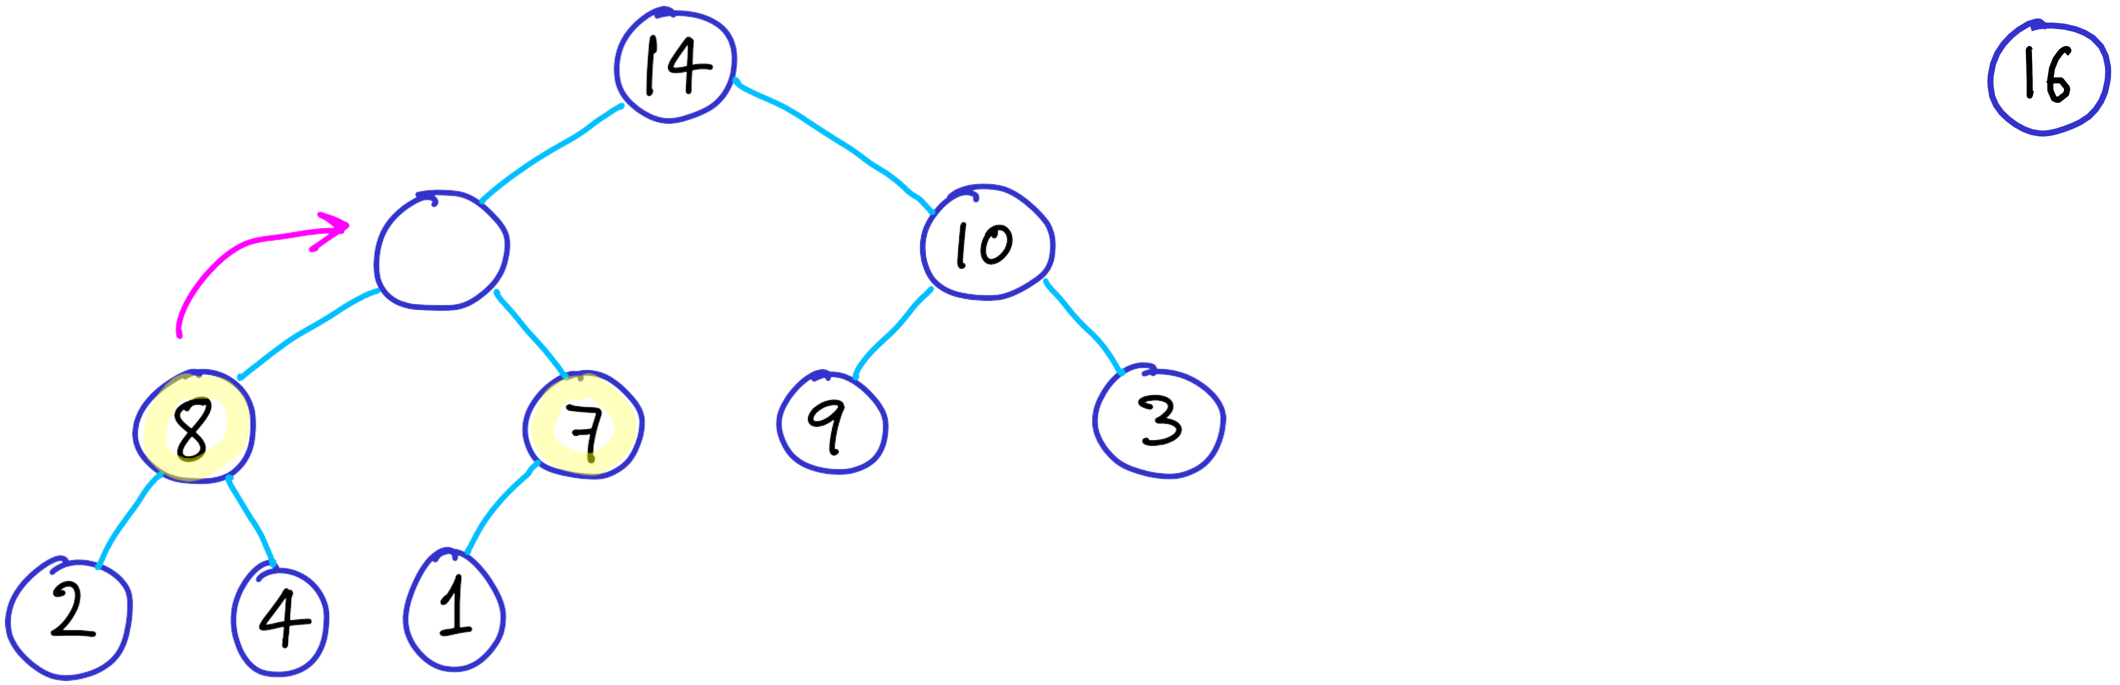


How to sort data in a heap

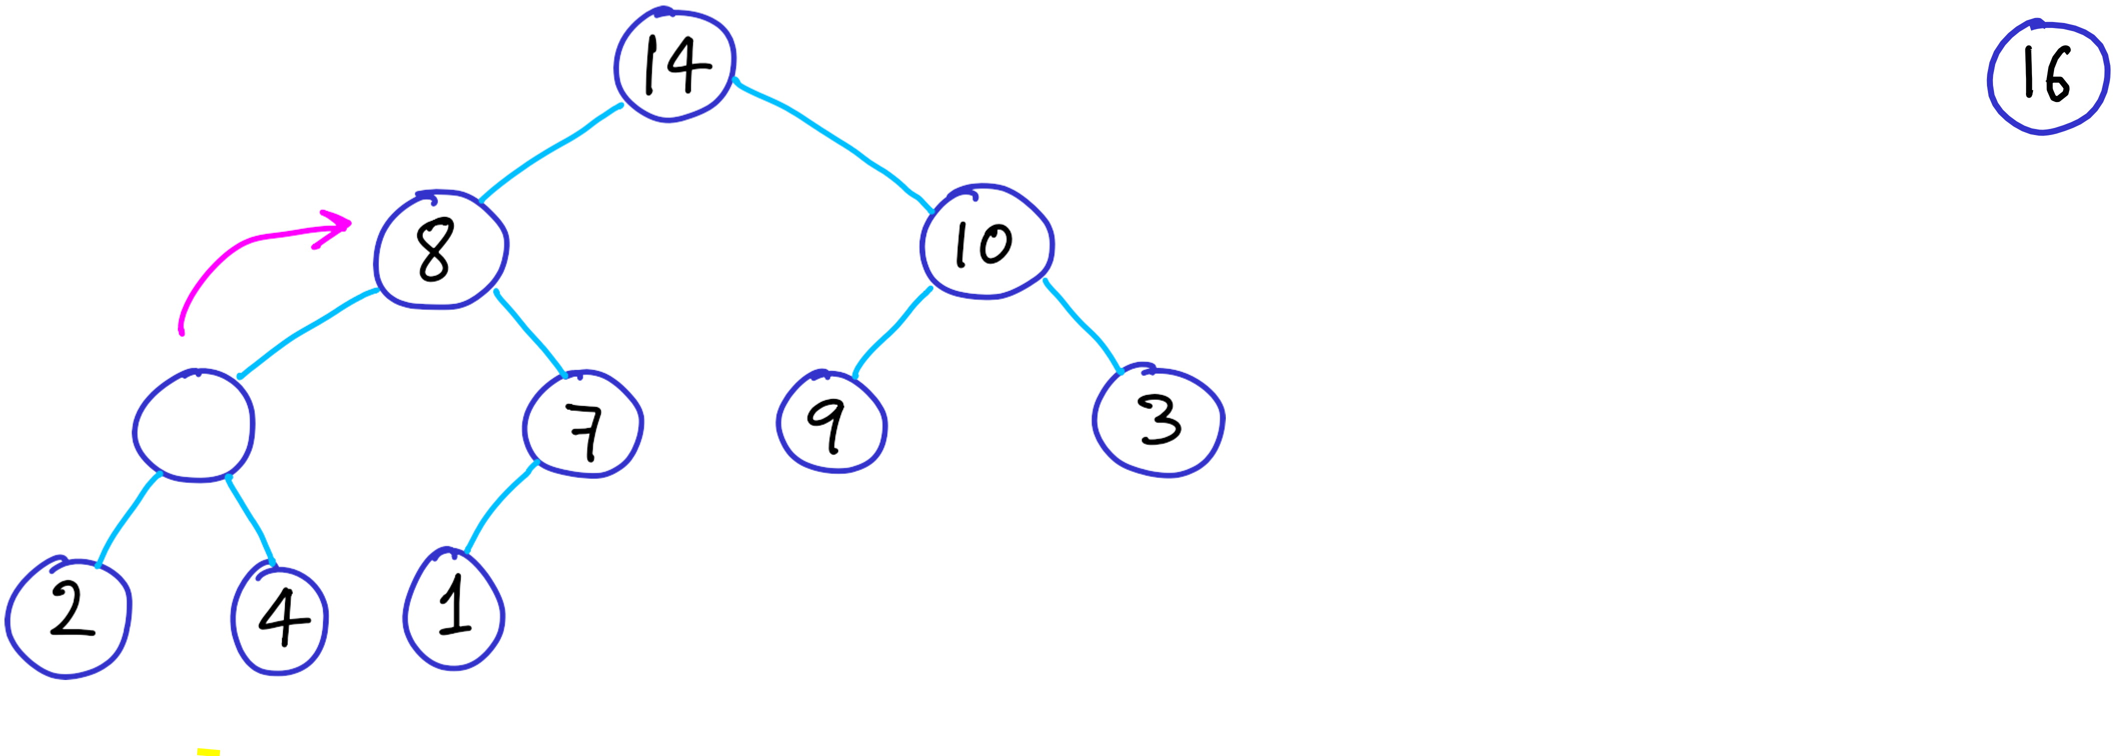


How to sort data in a heap

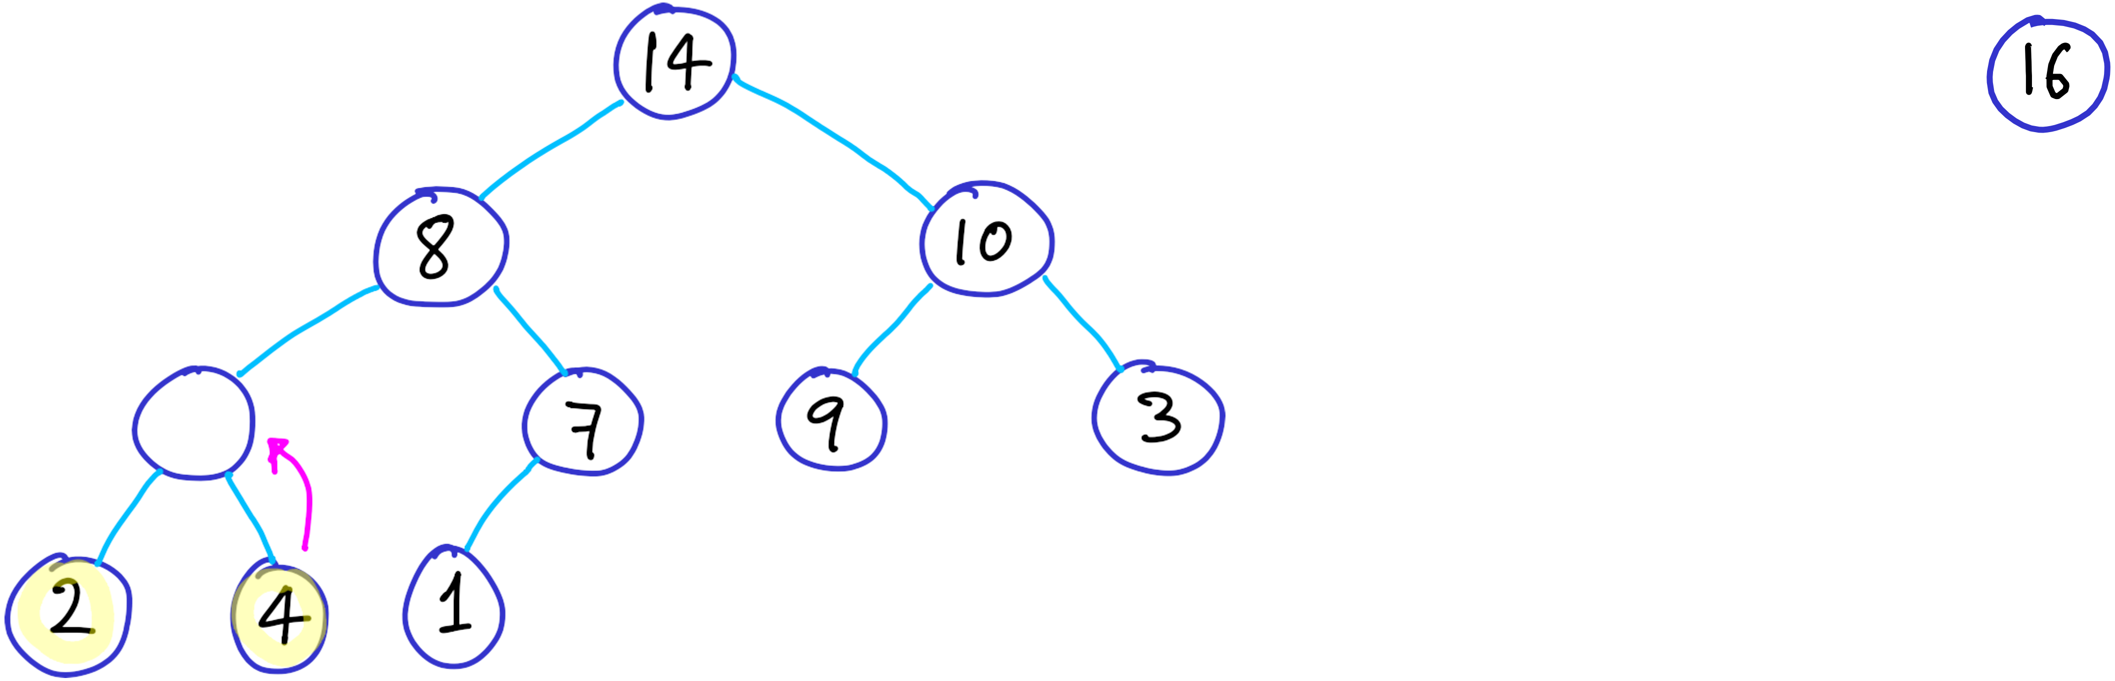
Update max recursively



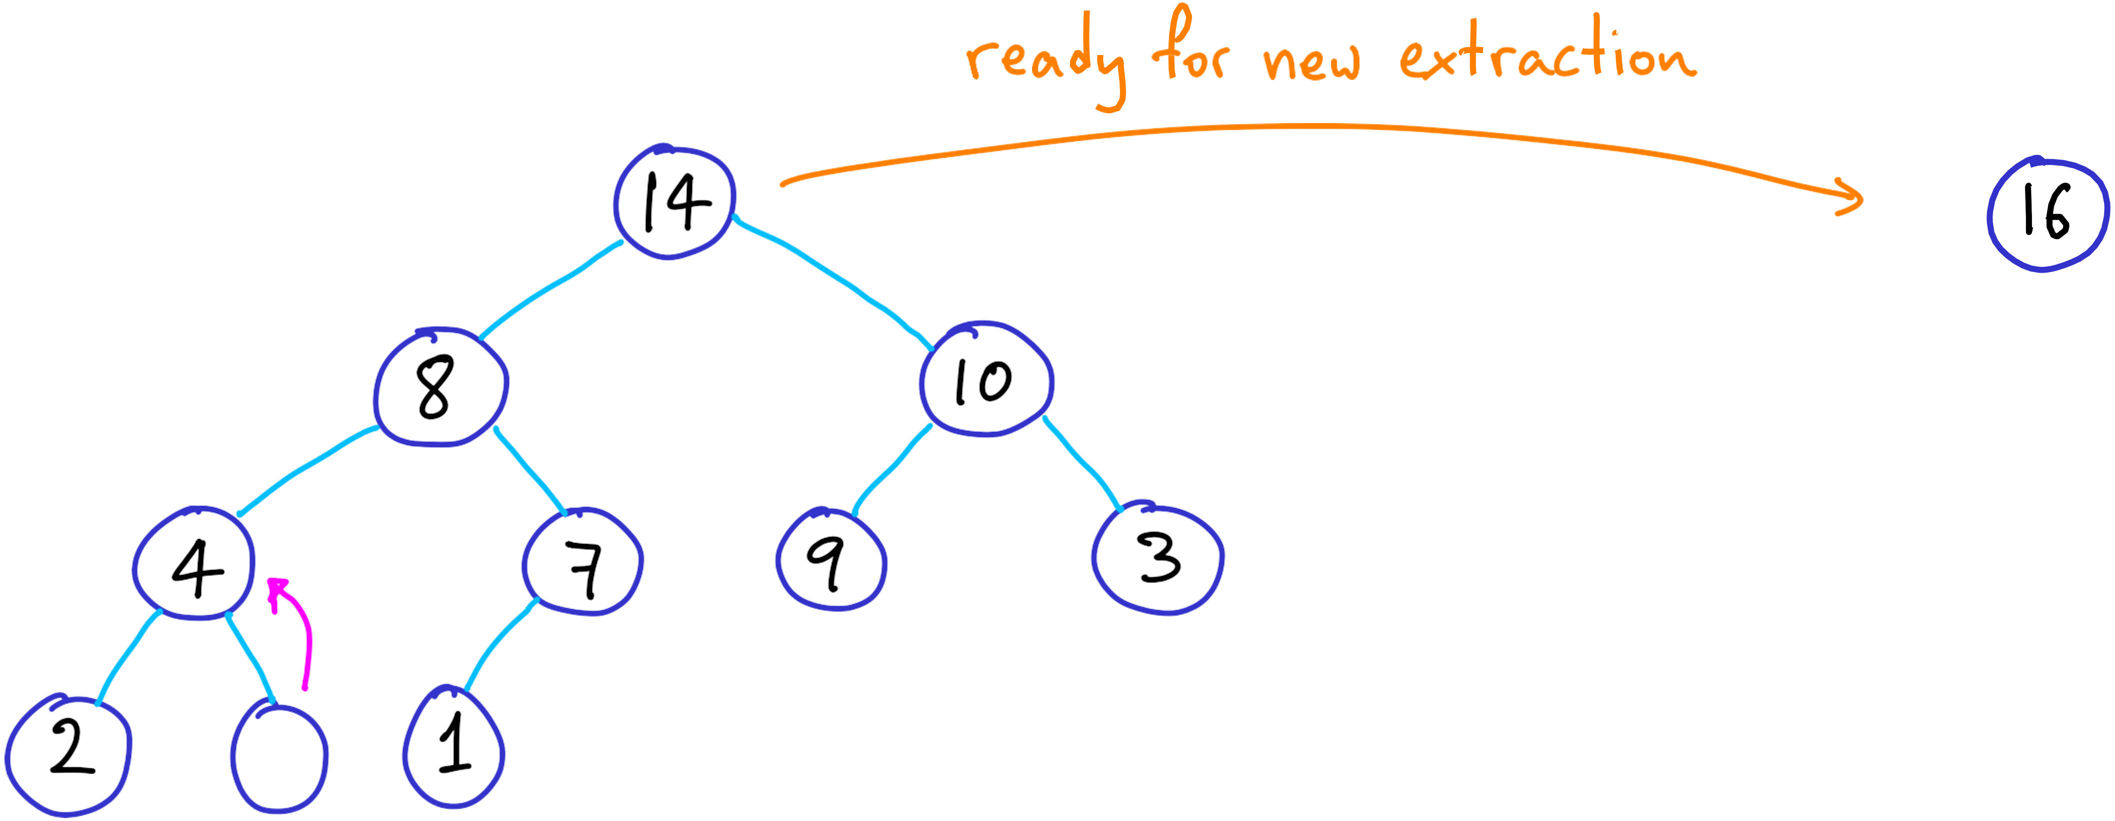
How to sort data in a heap



How to sort data in a heap

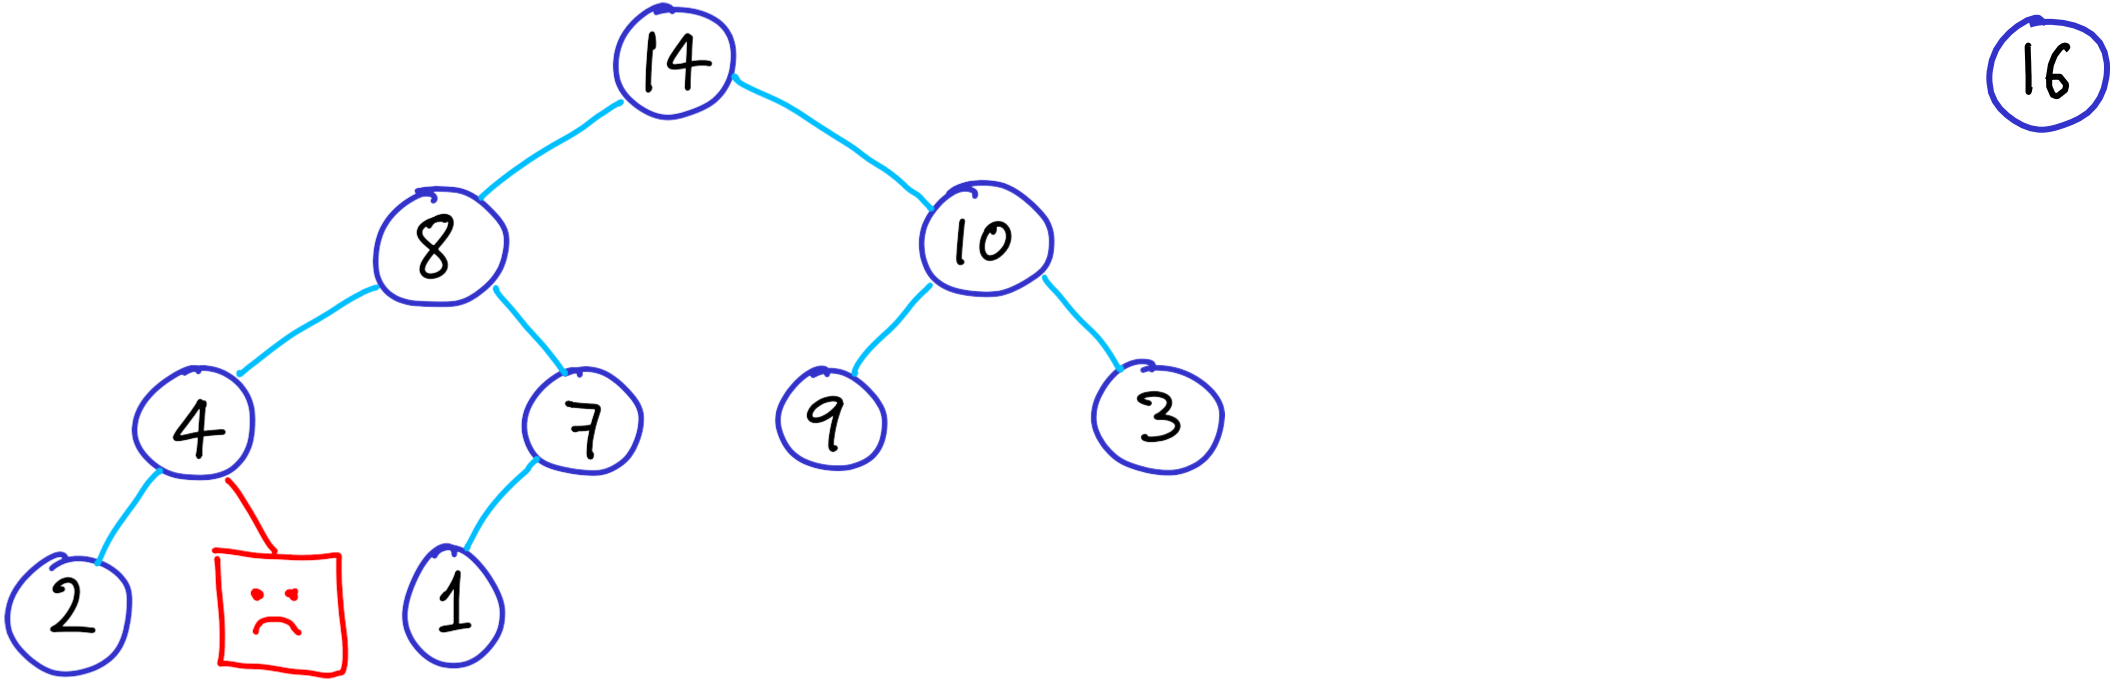


How to sort data in a heap



How to sort data in a heap

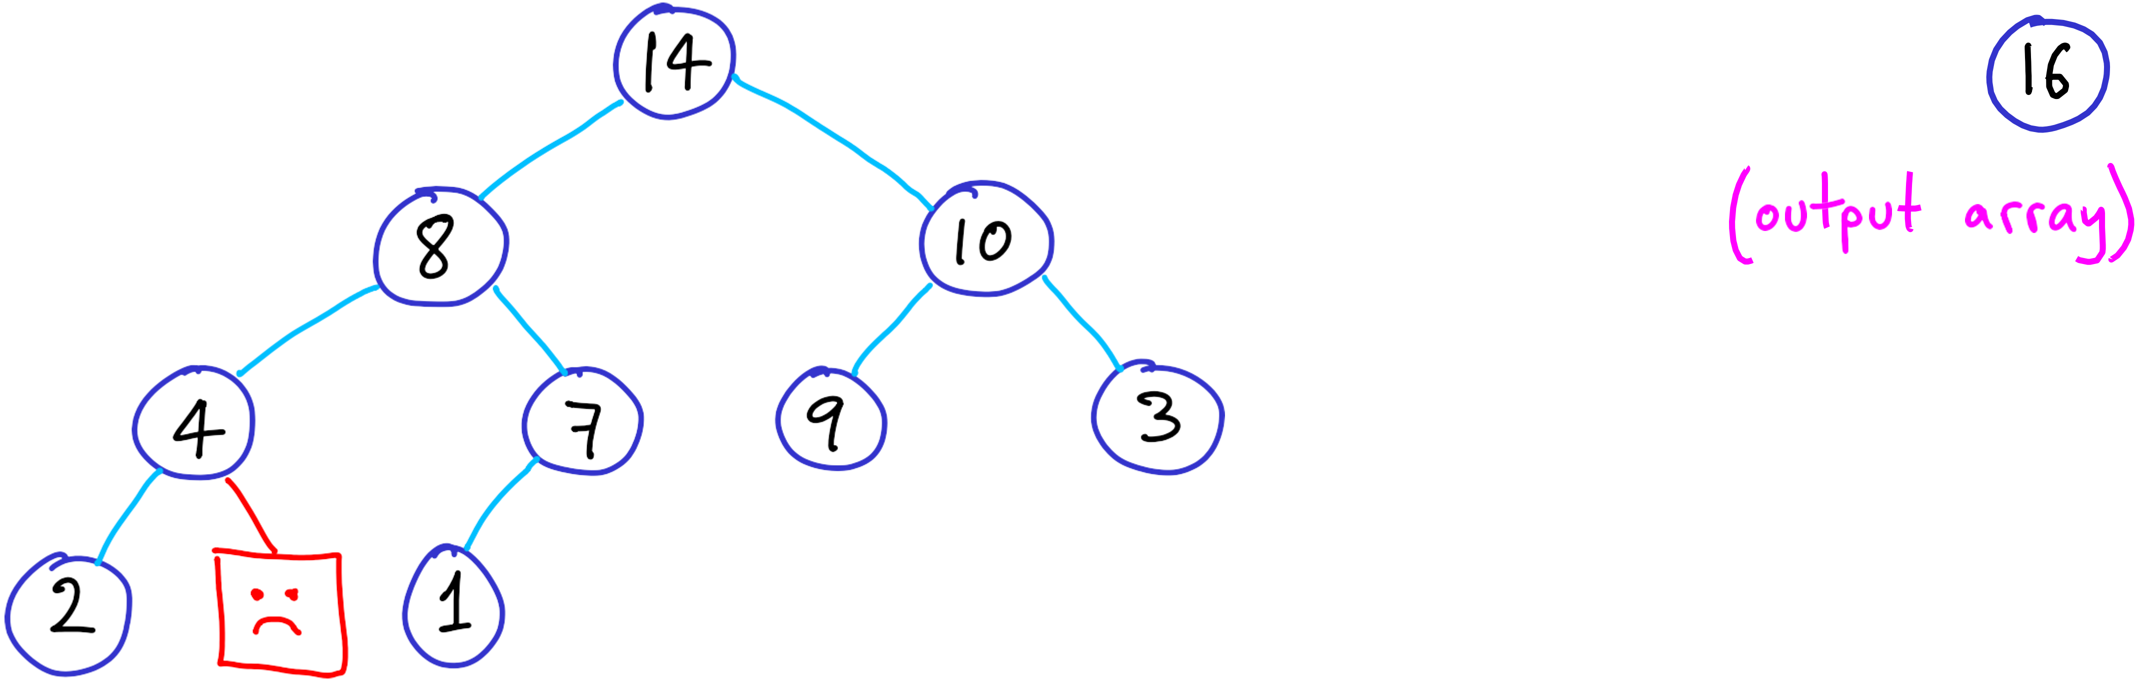
↳ if we don't care about keeping the heap complete



How to sort data in a heap

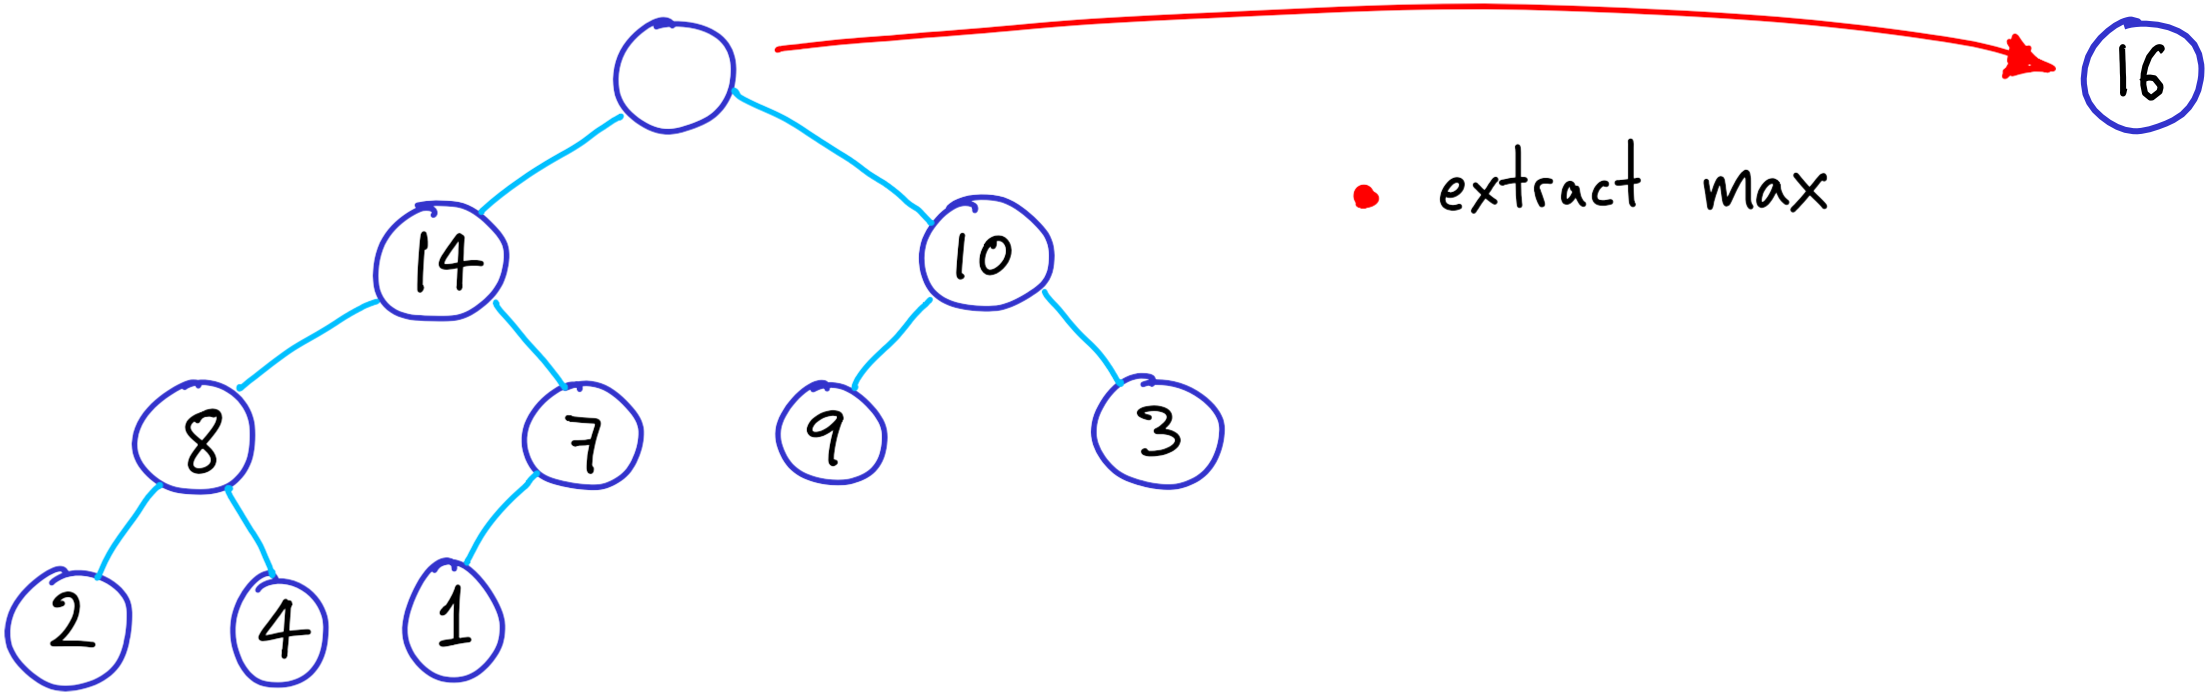
↳ if we don't care about

- keeping the heap complete
- using extra space



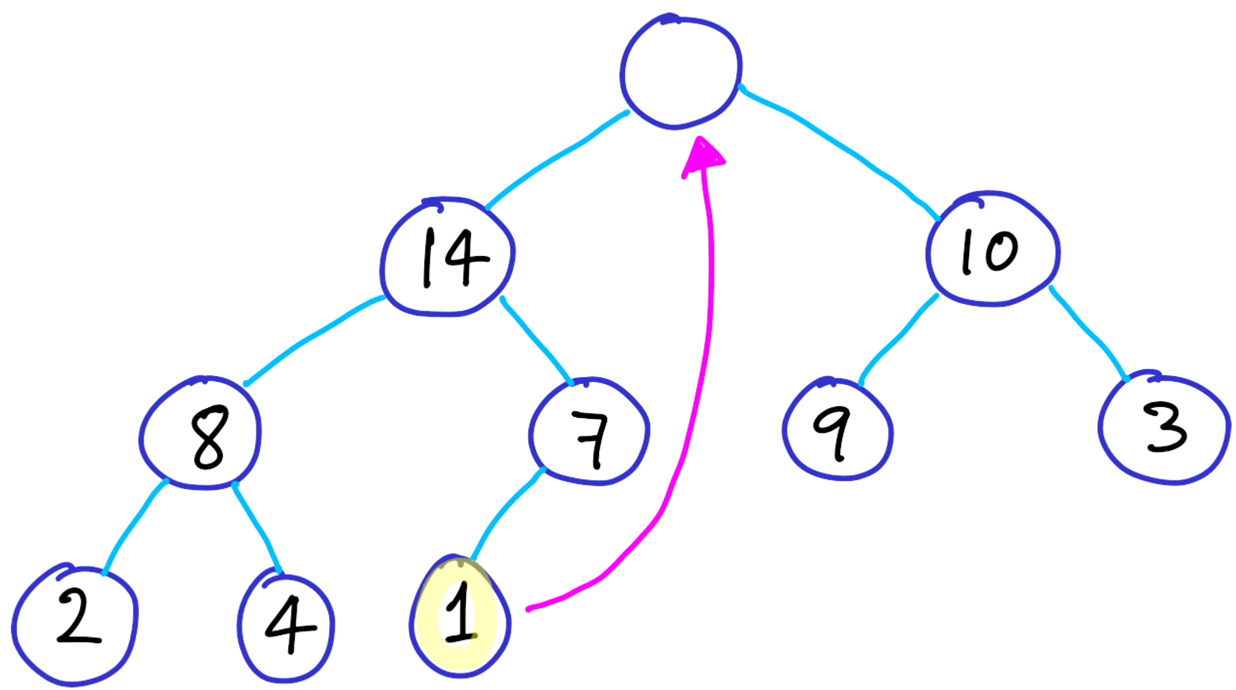
How to sort data in a complete heap ... using extra space

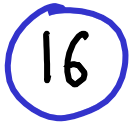
How to sort data in a complete heap ... using extra space



- extract max

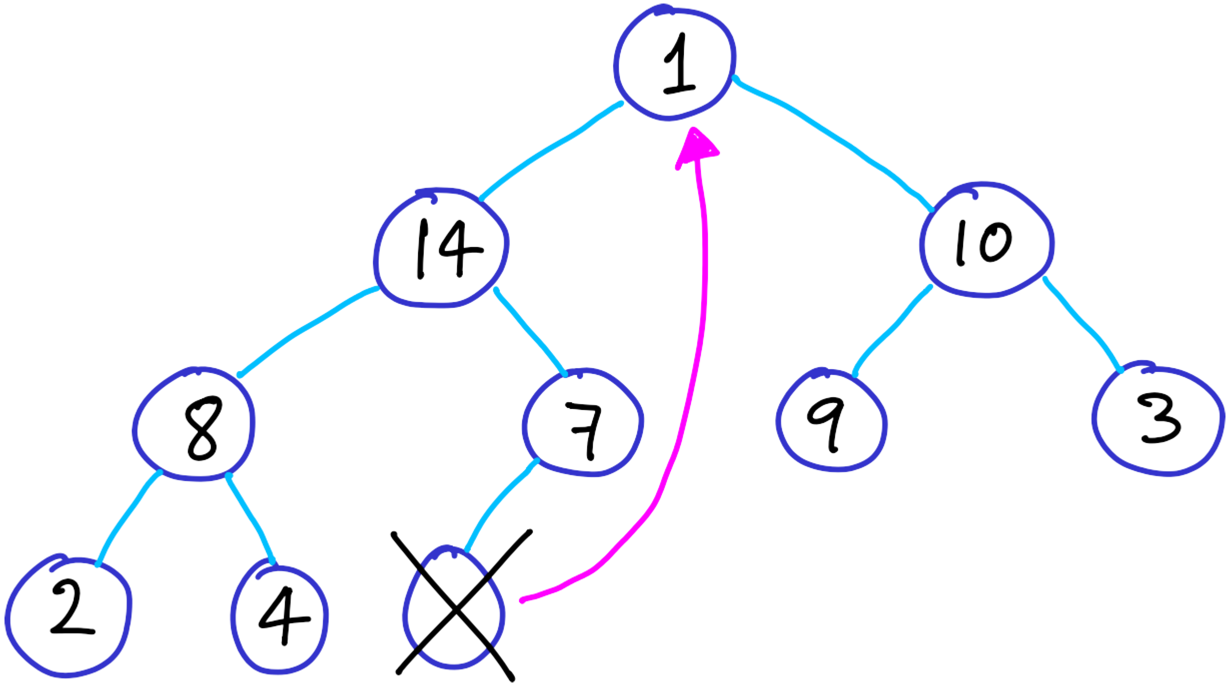
How to sort data in a complete heap ... using extra space

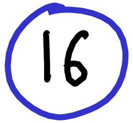




- extract max
- replace root
  with rightmost leaf
  from lowest level

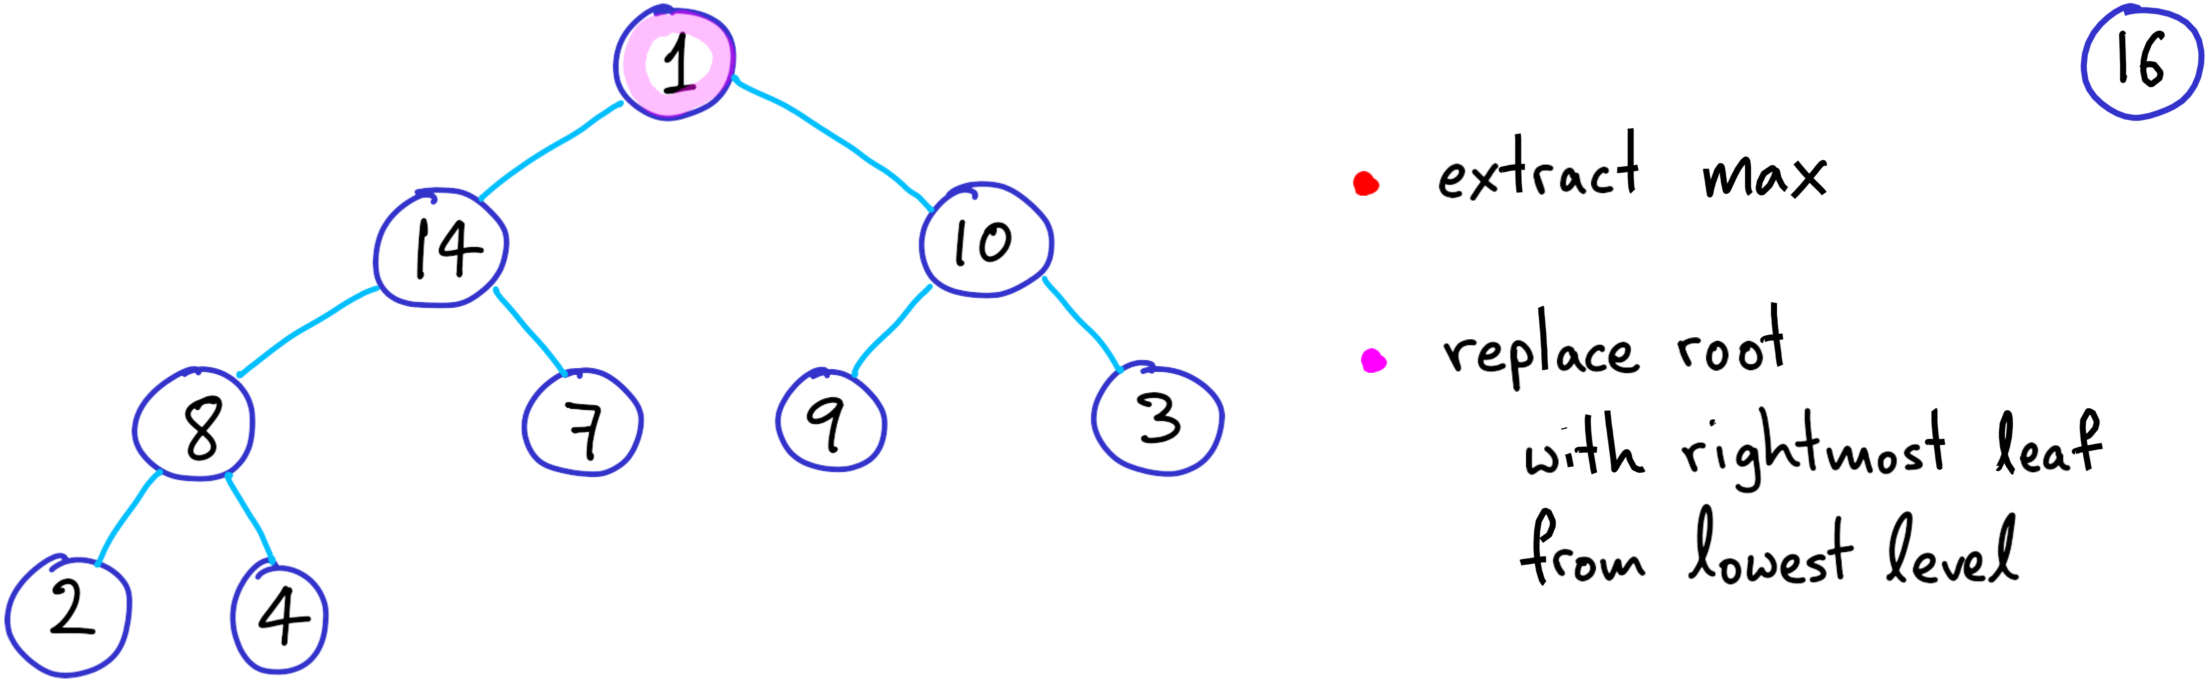
How to sort data in a complete heap ... using extra space





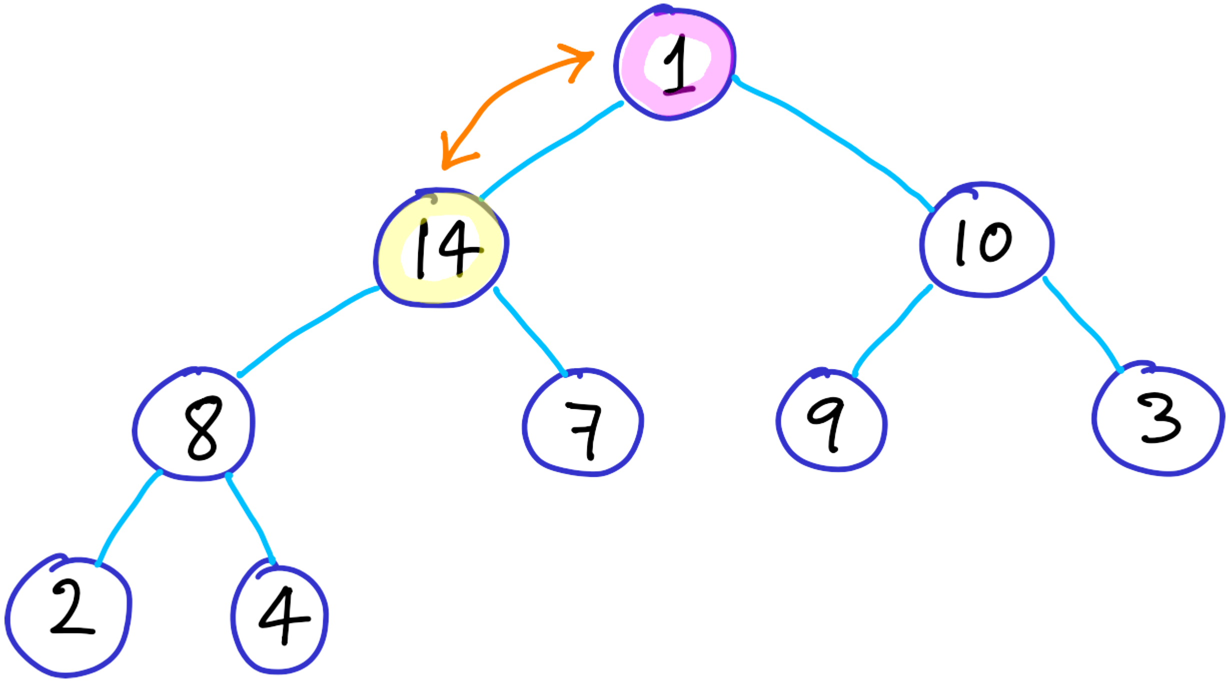
- extract max
- replace root
  with rightmost leaf
  from lowest level

How to sort data in a complete heap ... using extra space



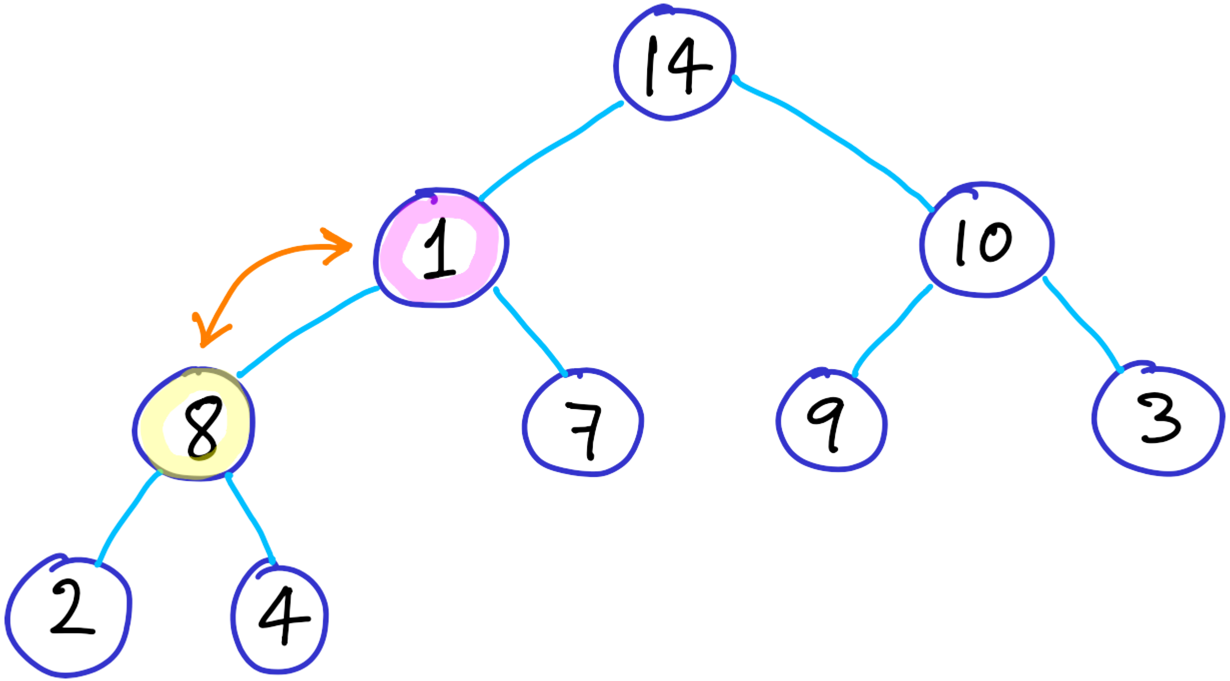
- extract max
- replace root with rightmost leaf from lowest level

How to sort data in a complete heap ... using extra space



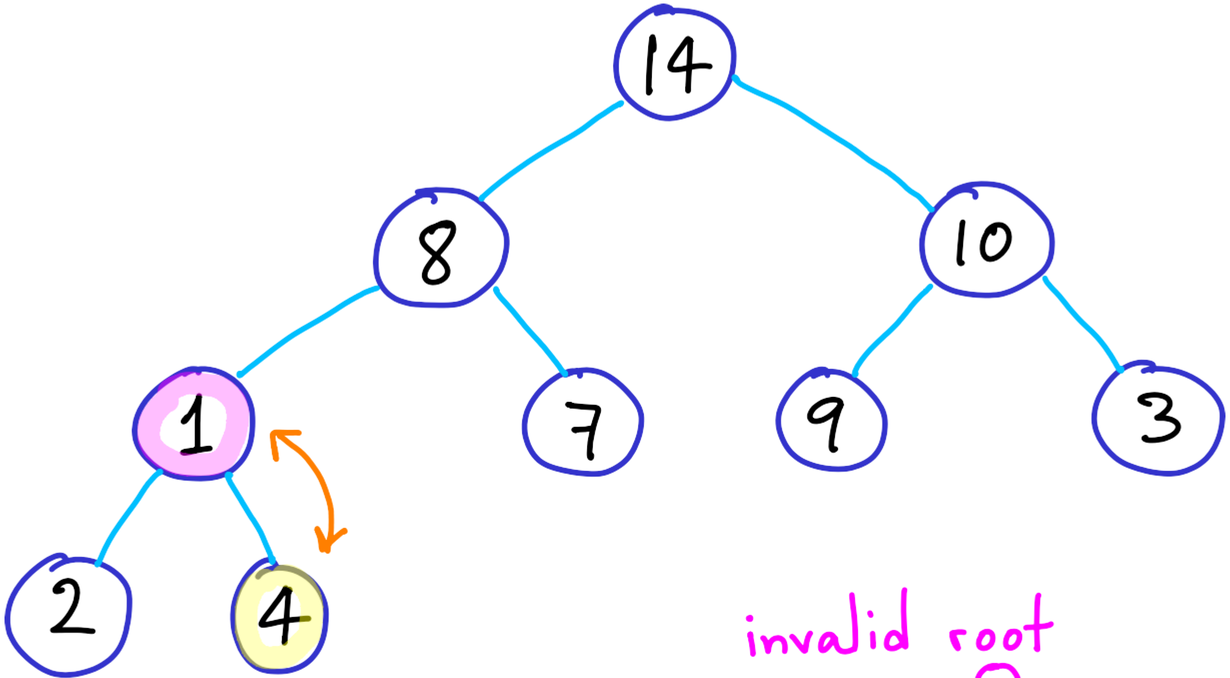
- ● extract max
- ● replace root
  with rightmost leaf
  from lowest level
- ● recursively swap
  with largest child
  while heap not restored

How to sort data in a complete heap ... using extra space



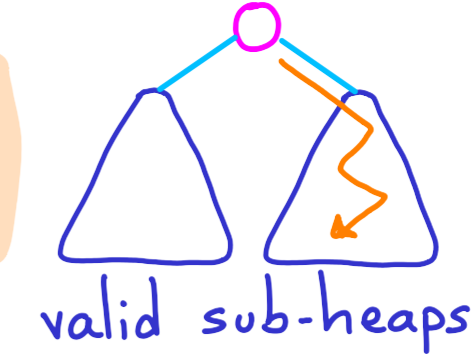
- 🔴 extract max
- 🟣 replace root
  with rightmost leaf
  from lowest level
- 🟠 recursively swap
  with largest child
  while heap not restored

How to sort data in a complete heap ... using extra space



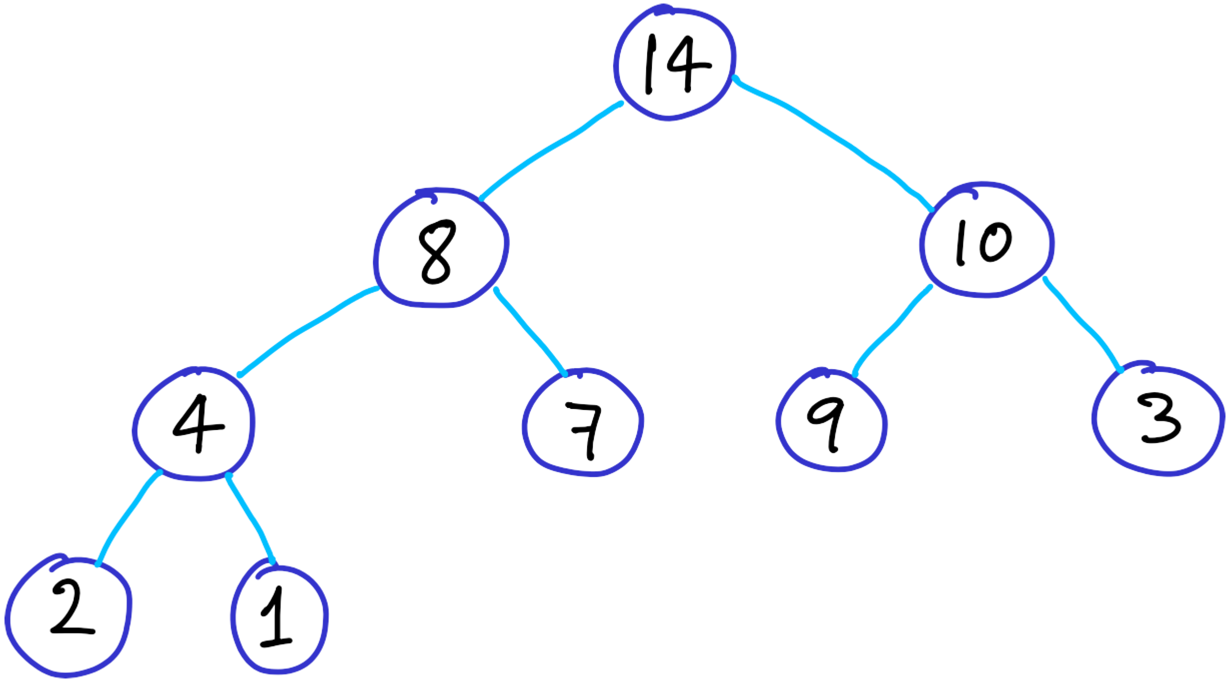
- extract max
- replace root
  with rightmost leaf
  from lowest level

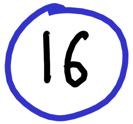
"heapify"



- recursively swap
  with largest child
  while heap not restored

How to sort data in a complete heap ... using extra space

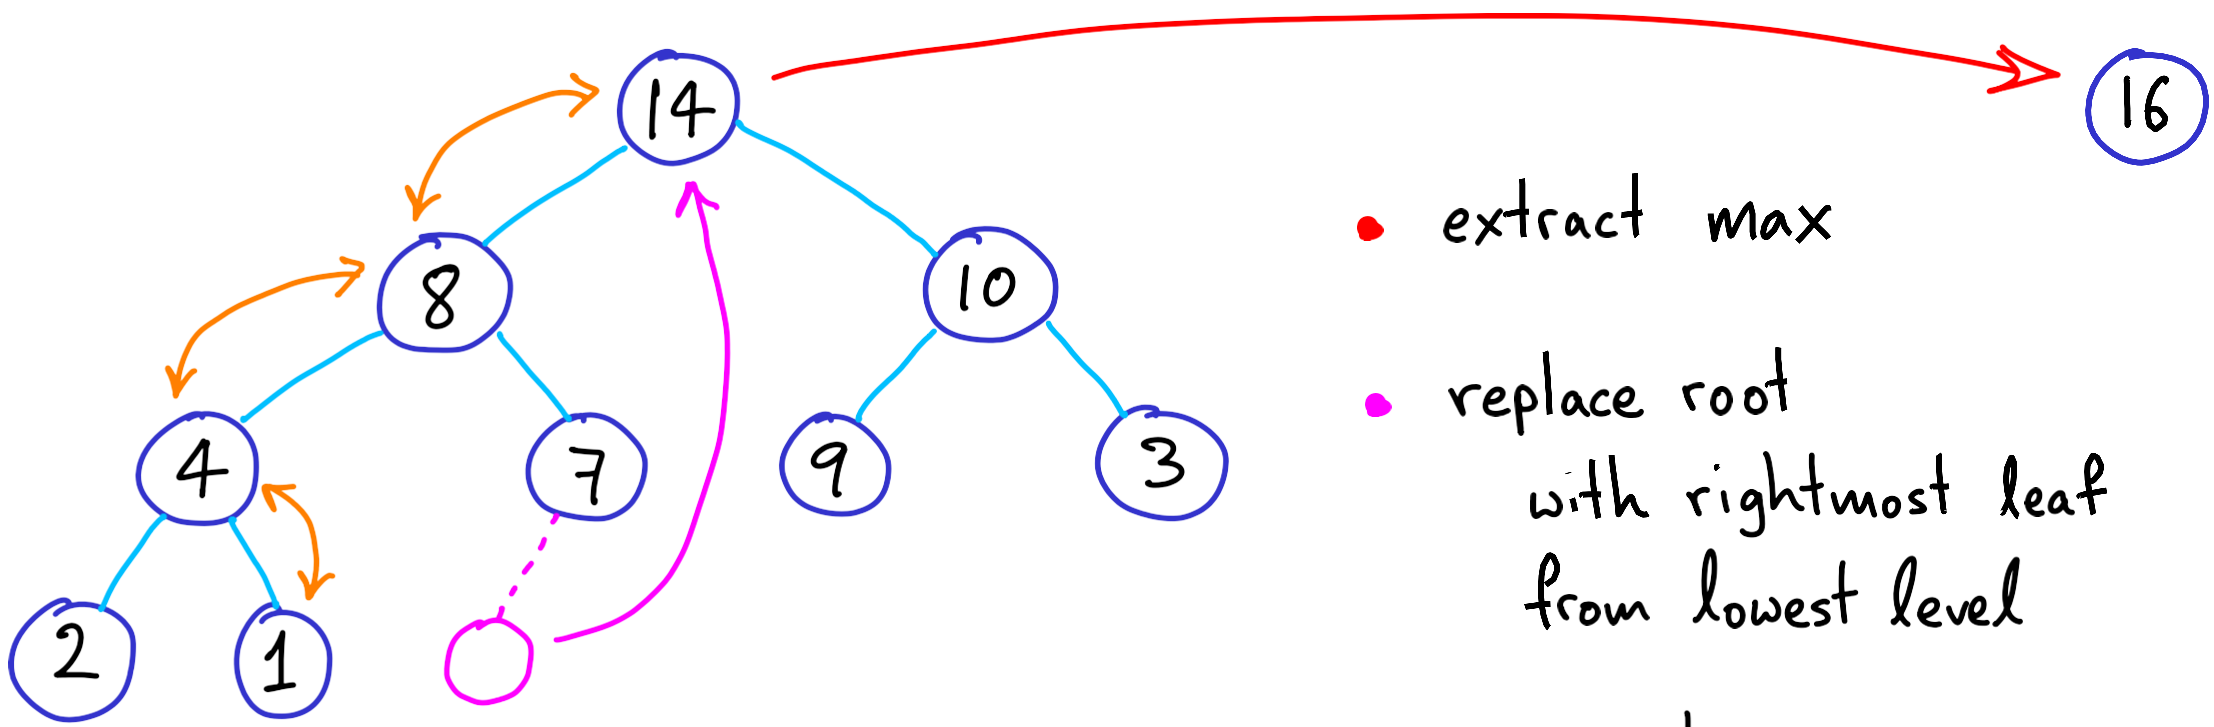




- extract max
- replace root
  with rightmost leaf
  from lowest level
- recursively swap
  with largest child
  while heap not restored

time ?

How to sort data in a complete heap ... using extra space

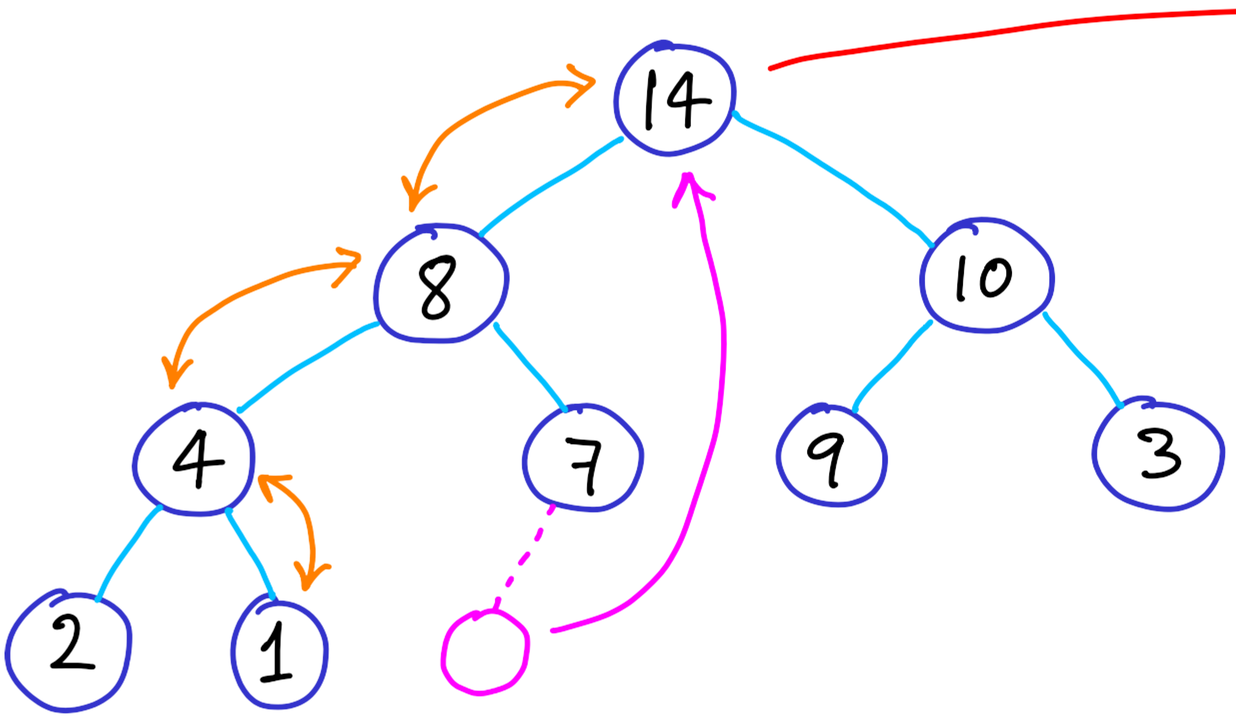


- extract max
- replace root with rightmost leaf from lowest level
- recursively swap with largest child while heap not restored

time ?

O(logn) per extraction

How to sort data in a complete heap ... using extra space



- extract max
- replace root with rightmost leaf from lowest level
- recursively swap with largest child while heap not restored

time = O(nlogn)

O(logn) per extraction

How to sort data in a complete heap in place

(without an output array)

How to sort data in a complete heap in place

(without an output array)

Summary

Given a heap we can extract max and heapify in $O(\log n)$ time.

↳ n rounds : $O(n\log n)$ to sort a heap

Summary

Given a heap we can extract max and heapify in $O(\log n)$ time.

↳ n rounds : $O(n \log n)$ to sort a heap

How do we construct a heap in the first place?
