

Termination

$\forall m, m \notin \text{FreeM} \iff \exists w \text{ s.t. } (m, w) \in \text{Tent}$   
 $\forall w, w \notin \text{FreeW} \iff \exists m \text{ s.t. } (m, w) \in \text{Tent}$  } *freeM/freeW keeps track of unmatched workers*

$\forall m, w, (m, w) \in \text{Tent} \rightarrow \text{MatchM}[m] = w \wedge \text{MatchW}[w] = m$   
 $\forall m, \text{MatchM}[m] \neq \text{NIL} \rightarrow (m, \text{MatchM}[m]) \in \text{Tent}$   
 $\forall w, \text{MatchW}[w] \neq \text{NIL} \rightarrow (\text{MatchW}[w], w) \in \text{Tent}$  } *MatchM/MatchW keeps track of current matching*

$\forall m \ m \in \text{FreeM} \iff \text{MatchM}[m] = \text{NIL}$   
 $\forall w \ w \in \text{FreeW} \iff \text{Match}[w] = \text{NIL}$

✓  $\forall w, w \in \text{FreeW} \iff \neg \exists m \text{ s.t. } (m, w) \in \text{Invites}$  } *welders free iff no invitations yet*

$\text{Invites} = \bigcup_{i=1}^n \bigcup_{j=1}^{\text{Next}[i]-1} \{ (m_i, \text{PrefM}[i][j]) \}$  } *Next keeps track of invitations*

✓ *Tent is a matching*  
 $\text{Tent} \subseteq \text{Invites}$   
 $|\text{Invites}| = k$

$\forall w, j < k, \text{MatchW}^j[w] \neq \text{NIL} \rightarrow \text{MatchW}^{j+1}[w], \dots, \text{MatchW}^k[w] \neq \text{NIL}$   
*one welder is matched, always matched (receives invitation)*

$\forall w, j < k, \text{MatchW}^j[w] \neq \text{NIL} \rightarrow w \text{ prefers } \text{MatchW}^{j+1}[w] \text{ to } \text{MatchW}^j[w], \text{ or they are same}$   
*each welder's sequence of matches gets better*

*Termination:* After  $n^2$  iterations,  $|\text{Invites}| = n^2$  and so  $= M \times W$ .  
 Then there is no  $m$  (let alone  $m \in \text{FreeM}$ ) s.t.  $\exists w \text{ s.t. } (m, w) \notin \text{Invites}$

*Post-condition:* Tent is a perfect matching  
 Proof: suppose not - then  $\exists$  unmatched  $m$  and unmatched  $w$   
 $m \in \text{FreeM}, w \in \text{FreeW}$   
 $(m, w) \notin \text{Invites}$   
 guard is T  $\Rightarrow \Leftarrow$   
 $\therefore$  Tent is a perfect matching

Tent is stable

Proof: Suppose not - there is a  $(m, w')$  that is an instability w.r.t Tent  
 so  $m$  prefers  $w'$  to  $\text{MatchM}[m] = w$  (def instability)  
 and  $w'$  prefers  $m$  to  $\text{MatchW}[w'] = m'$   
 $(m, w') \notin \text{Tent}$

$(m, w) \in \text{Tent}$   
 $(m, w) \in \text{Invites}$  }  $(w, w'; \text{MatchM}[m] = w)$   
 $(w, w'; \text{Tent} \subseteq \text{Invites})$  } *need to add this to Inv, easy to prove*

$(m, w') \in \text{Invites}$  }  $(m \text{ makes invites in } \downarrow \text{ order, and } (m, w) \in \text{Invites} \text{ and } m \text{ prefers } w')$

Consider iteration  $k$  when  $(m, w')$  added to Invites

Two cases: 1) accepted, so  $\text{Match}^k[w'] = m$   
 but  $\text{Match}^{\text{old}}[w'] = m' \neq m$  ( $(m, w) \in \text{Tent}$ )  
 so  $w'$  prefers  $m'$  to  $m$  ( $w'$ : welder's matches  $\uparrow$ )

$\Rightarrow$  rejected, so  $\text{Match}^{k-1}[w'] = m''$  and  $w'$  prefers  $m''$  to  $m$  (condition on if that leads to this case)  
 $\text{Match}^k[w'] = m''$   
 $\vdots$   
 $\text{Match}^{\text{old}}[w'] = m' \dots$  } *substitute  $m'' = m'$*

$$\text{Match}^*(w) = m''$$

Let  $\text{Match}^*(w) = m'$  where either  $m'' = m'$  and so  $w$  prefers  $m'$  to  $m$

or  $m'' \neq m'$ , so

$w$  prefers  $m'$  to  $m''$

and

$m'$  to  $m$

(IMV:  $w$ 's matches  $\uparrow$ )  
(transitivity)

that leads to this case)  
substitute  $m'' = m'$

in all cases,  $w$  prefers  $m'$  to  $m$   $\Rightarrow \Leftarrow$

$\therefore$  no instability

$\therefore$  stable

$w$  is a valid partner for  $m$  if there is some stable matching  $S$  s.t.  $(m, w) \in S$

best( $m$ ) is  $m$ 's best valid partner

(1st valid partner on  $m$ 's preference list) stable matching #1      stable matching #2

A	X <sup>1</sup> YVWZ	V	ADCEB	(A, Y)	(A, V)
B	VXWYZ	W	ABDCE	(B, W)	(B, W)
C	VZWXZ	X	DECAB	(C, Z)	(D, X)
D	WVXYZ	Y	CBAED	(D, V)	(C, Y)
E	X <sup>2</sup> YVWZ	Z	ABDEC	(E, X)	(E, Z)

V, Y both valid partners of A; is X a valid partner?  
 X, Z both valid partners of E; X is best valid partner

G-S always returns  $\{(m, \text{best}(m)) \mid m \in M\}$  so these are best valid partners

Proof: Suppose not. Then some execution  $\mathcal{E}$  of G-S returns  $S$  where  $(m^*, w^*) \in S$  but  $w^* \neq \text{best}(m^*)$

$m^*$  invited  $\text{best}(m^*)$  before  $w^*$  in  $\mathcal{E}$  (invitations in  $\downarrow$  order of pref)

so there is a rejection by a best valid partner in  $\mathcal{E}$  ( $\text{best}(m^*)$  rejected  $m^*$ )  
 so there is a rejection by a valid partner in  $\mathcal{E}$  (best valid  $\rightarrow$  valid)

if  $\text{best}(m) \neq w$  then  
 $m$  prefers  $\text{best}(m)$  to  $w$  (def best)  
 $m$  invited  $\text{best}(m)$  before  $w$  (invites  $\downarrow$ )  
 $m$  rejected by  $\text{best}(m)$  before making invitation to  $w$  (otherwise no more invites)  
 that's the 1st rejection by a valid partner  $\rightarrow$

consider 1st rejection in  $\mathcal{E}$  by a valid partner:  $w$  rejects  $m$  (well-ordering)  
 then  $w = \text{best}(m)$

$w$  rejects  $m$  in favor of  $m'$  where  $w$  prefers  $m'$  to  $m$  (code for rejection)

there is some stable matching  $S'$  s.t.  $(m, w) \in S'$  (def. valid)

find  $m'$  s.t.  $(m', w) \in S'$  then  $w \neq w'$  (must exist  $\because S'$  is perfect matching) ( $S'$  is a matching;  $m \neq m'$ )

$w'$  is a valid partner of  $m'$  ( $(m', w') \in S'$ ,  $S'$  is stable; def. valid)

$m'$  prefers  $w$  to  $w'$

$(m', w)$  is instability in  $S'$   $\Rightarrow$  (def. instability)

$\therefore$  G-S returns  $\{(m, \text{best}(m)) \mid m \in M\}$

back to  $\mathcal{E}$ :  $w$  rejected  $m$  for  $m'$

2 cases: that rejection was immediate  $\because w$  already matched with  $m'$  or

$w$  initially accepted  $m$  but broke tentative match on getting invite from  $m'$

1st rejection by valid  $\rightarrow m \rightarrow w$  (no immediately rejects  $m$ )

1st rejection by valid ( $w$  switches away from  $m$ )

but if  $m'$  prefers  $w$  to  $w'$ , then invitation  $m' \rightarrow w'$  must be before  $m' \rightarrow w$  (invites in  $\downarrow$  order)

and invitation must be rejected before  $m'$  invites  $w$  (only way to make  $m'$  free to make more invitations)

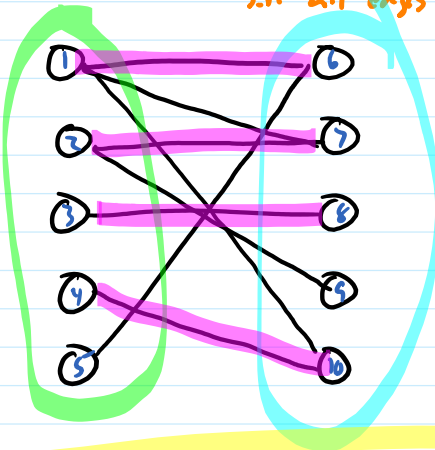

and invitation must be rejected before  $m'$  invites  $w$  (only way to make  $m'$  free to make more invitations)  
of  $m'$  by  $w'$   
in either case, that rejection<sub>1</sub> is by a valid partner and before the 1<sup>st</sup> rejection by a valid partner  $\Rightarrow$

Examples

Stable Matching :  $G-S$

Bipartite Matching : Given bipartite  $G$ , find maximum matching

↳ can split vert into 2 sets  
s.t. all edges between sets

find maximum matching  
↓  
subset of edges s.t.  
each vert incident on  $\leq 1$  edge

Interval Scheduling : Given  $n$  requests with start  $s(i)$ , finish  $f(i)$   
find largest set of non-overlapping requests  
compatible

Weighted Interval Scheduling : add weight  $w_i$  to each request, find set of compatible requests that maximizes total weight

Independent Set : Given graph  $G$ , find largest set of vertices s.t. no edges between vertices in set

NP-complete

brute force: try all  $2^n$  possible subsets

Competitive Facility Location : Given  $G$  with weighted verts, bound  $B$   
game between  $P1, P2$  alternating choosing  
vert s.t. not adjacent to already chosen,  
is there a strategy for  $P2$  to guarantee  
a total  $\geq B$ ?

PSPACE-complete

# Continuing Education Credits

max is 3 compatible intervals

## Interval Scheduling

Given intervals labelled  $1, \dots, n$  w/ interval  $i$ 's start, finish =  $s(i), f(i)$ ,  
find largest set of pairwise compatible intervals

interval  $i, j$  ( $i \neq j$ )

compatible if  $s(i) \leq f(i) \leq s(j) \leq f(j)$   
or vice versa

Greedy: choose 1<sup>st</sup> start?

No:

choose shortest?

No

choose last finish?

No

fewest overlaps?

works for prev examples, but no:

From Jyh-haw Keh,  
Boise State

choose 1<sup>st</sup> to finish...
