

Homework Assignment 7

Due on Monday, November 6, 2017.

Problem 1: ElGamal Authentication

Once Happy understood ElGamal signatures, he was excited to use them for authentication. He wants to send an authenticated message m to Bob so that Bob can verify that m came from him.

Happy has an ElGamal signing key (g, p, x) and Bob has the corresponding verification key (g, p, a) . We denote the signing algorithm using that key pair by S and the verification algorithm by V . Happy and Bob also have a cryptographic hash function h whose output is the same length as the signatures produced by S .

Here's Happy's idea. Bob sends him a fresh tag r . Happy signs r and attaches it to a hash of his message. Bob checks the tag's signature and accepts the message.

Happy		Bob
1.	\xleftarrow{r}	Choose random string r .
2. Compute $s = S(r) \oplus h(m \oplus r)$	$\xrightarrow{(m,s)}$	Check $V(r, s \oplus h(m \oplus r))$. Accept m as coming from Happy if check succeeds.

Questions

- (a) Describe why Bob accepts every message that Happy sends in this way (assuming no errors in transmission).
- (b) Mallory wants to replace m with a message m' of his choosing and get Bob to accept it as valid. Describe in detail how he can do this. Assume that Mallory is carrying out a man-in-the-middle attack, but she does not know Happy's signing key and cannot forge signatures $S(x)$ for messages x of Mallory's choosing.
- (c) Suggest a way to fix this protocol to thwart Mallory's attack. Your suggestion should not use any more rounds of communication nor assume any other encryption system or secret keys. Explain.

[Hint: Think about a better way to use h to "bind" m to the signature.]

Problem 2: Hash from Cryptosystem

Happy decided to build a hash function $H(M)$ out of the AES-128 encryption function E_k .

Define the function $f(s, m) = E_m(s) \oplus m$, where s and m have length 128. Let M be a message of arbitrary length. Here's how to compute $H(M)$.

- Pad M appropriately and divide it into 128-bit blocks $m_1 m_2 \dots m_t$.
- Compute the sequence:

$$\begin{aligned} s_1 &= m_1 \\ s_2 &= f(s_1, m_2) \\ s_3 &= f(s_2, m_3) \\ &\vdots \\ s_t &= f(s_{t-1}, m_t). \end{aligned}$$

- Define $H(M) = s_t$.

Questions

- Given any $k \geq 1$ and 128-bit string s_k , show how to find a message $M = m_1 m_2 \dots m_k$ such that $H(M) = s_k$.
[Hint: Use the fact that the decryption function $D_k()$ is the inverse of $E_k()$. This allows you to “work backwards” from s_k to s_1 .
- Show how to find a colliding pair (M, M') for $H()$.
