

# Transposition Table

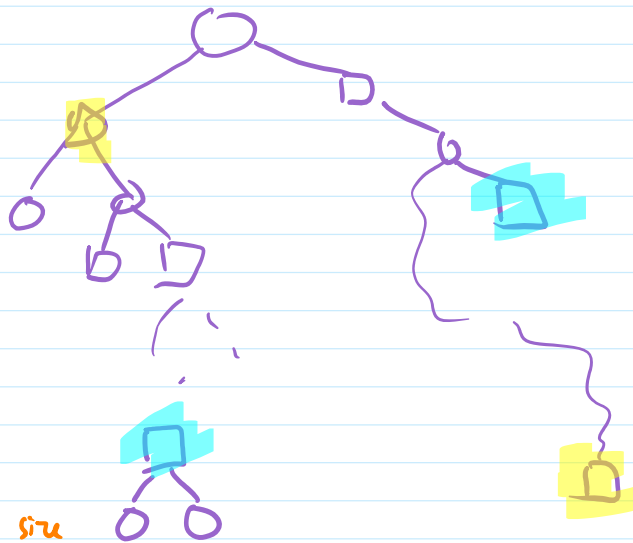

$\text{Minimax}(\text{pos}, h, \text{depth})$  <sup>heuristic</sup>  
 $\text{tt}$  <sup>level below pos at which to apply h</sup>  
 If pos is terminal, return  $\text{value}(\text{pos})$   
 If  $\text{depth} == 0$ , return  $h(\text{pos})$   
 if  $(\text{pos}, d)$  in  $\text{tt}$  for  $d \geq \text{depth}$  then return  $\text{tt}[\text{pos}, d]$   
 Else if pos is P1's turn then return  $\max_{\text{pos} \rightarrow \text{pos}'} \text{MM}(\text{pos}', h, \text{depth} - 1)$   
 Else return  $\min_{\text{pos} \rightarrow \text{pos}'} \text{MM}(\text{pos}', h, \text{depth} - 1)$   
 $\text{tt}[\text{pos}, \text{depth}] =$

## Transposition Table

memo (map from positions to position values)

ex. +1 for P1 winning state  
 -1 for P2  
 or some estimate

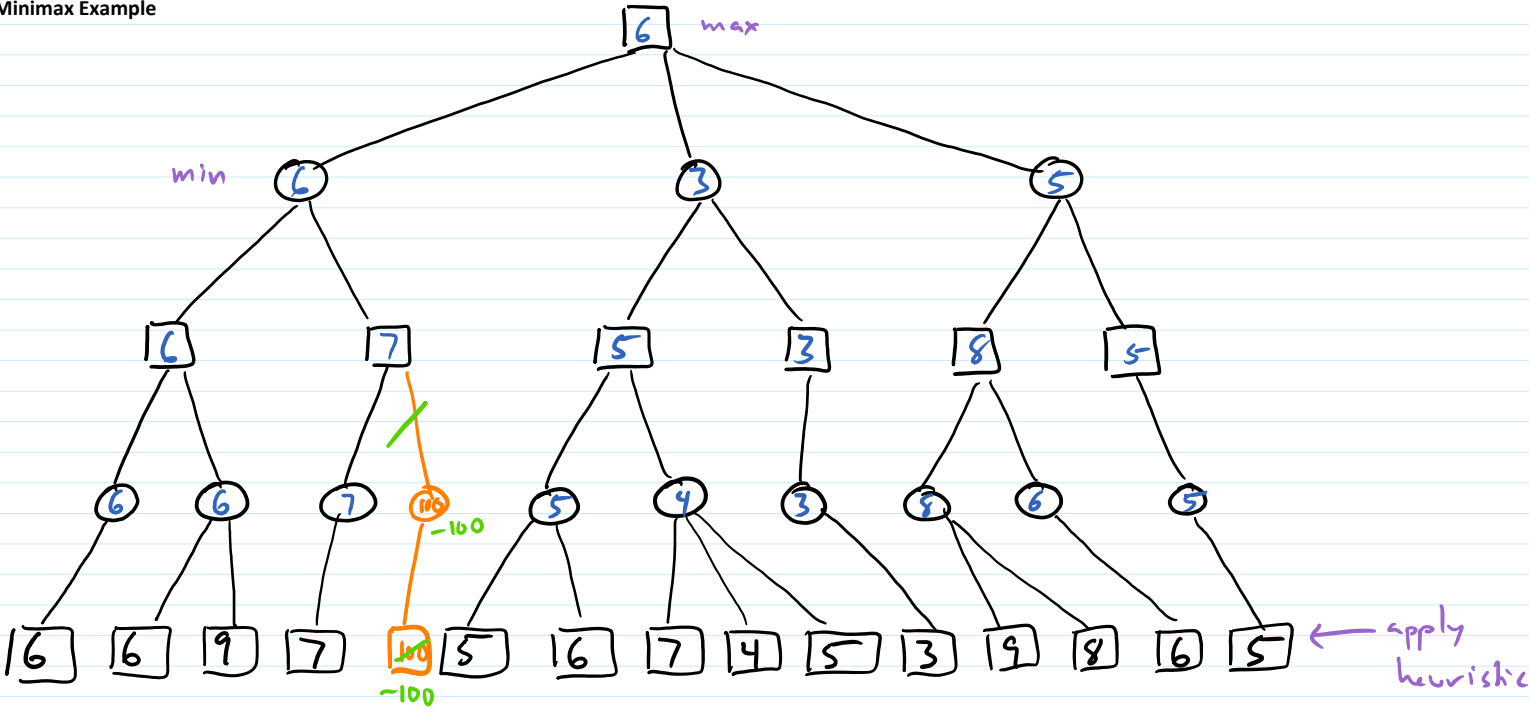

as trans. table grows,  
 use replacement policy to manage size

Minimax Example

Modified example from [http://en.wikipedia.org/wiki/Alpha%E2%80%93beta\\_pruning](http://en.wikipedia.org/wiki/Alpha%E2%80%93beta_pruning)

Minimax Example

Modified example from [http://en.wikipedia.org/wiki/Alpha%E2%80%93beta\\_pruning](http://en.wikipedia.org/wiki/Alpha%E2%80%93beta_pruning)

## Alpha-Beta Pruning

$-\infty, \infty$  for call to root (so returns same thing as  $MM(\text{root}, \text{depth}, h)$ )  
Alpha-Beta( $p, \alpha, \beta, \text{depth}, h$ ) returns

value( $p$ ) if  $p$  is terminal  
 $h(p)$  if  $\text{depth} = 0$

result of normal  
minimax (w/  
same depth, heuristic)

→  $MM(p, d, h)$  if  $\alpha \leq MM(p, d, h) \leq \beta$

lower bound on  $MM(p, d, h)$  if  $MM(p, d, h) \geq \beta$

upper bound on  $MM(p, d, h)$  if  $MM(p, d, h) \leq \alpha$

if  $\text{depth} = 0$  then return heuristic( $p$ )

if  $p$  is terminal then return value( $p$ )

if  $p$  is a max position

$a \leftarrow -\infty$

for each position  $p'$  reachable in one move from  $p$  and while  $\alpha < \beta$

$a \leftarrow \max(a, AB(p', \alpha, \beta, \text{depth}-1, h))$

$\alpha \leftarrow \max(\alpha, a)$

return  $a$

else

$b \leftarrow \infty$

for each position  $p'$  reachable in one move from  $p$  and while  $\alpha < \beta$

$b \leftarrow \min(b, AB(p', \alpha, \beta, \text{depth}-1, h))$

$\beta \leftarrow \min(\beta, b)$

return  $b$

$\leftarrow (\alpha, \beta) \rightarrow$

child 1  $\cdot$  )  
( $\alpha, \beta$ )

child 2  $\cdot \cdot$  )  
( $\alpha, \beta$ )

child 3  
( $\alpha, \beta$ )

child 4  $\cdot$  )  
( $\alpha, \beta$ )

child 5  
( $\alpha', \beta$ )
